

Deep Learning

Architectures and Methods: Convolutional Neural Networks 2

TECHNISCHE
UNIVERSITÄT
DARMSTADT

Thanks to John Canny, Ian Goodfellow,
Yoshua Bengio, Aaron Courville, Efstratios
Gavves, Kirill Gavrilyuk, Berkay Kicanaoglu,
and Patrick Putzky and many others for
making their materials publically available.

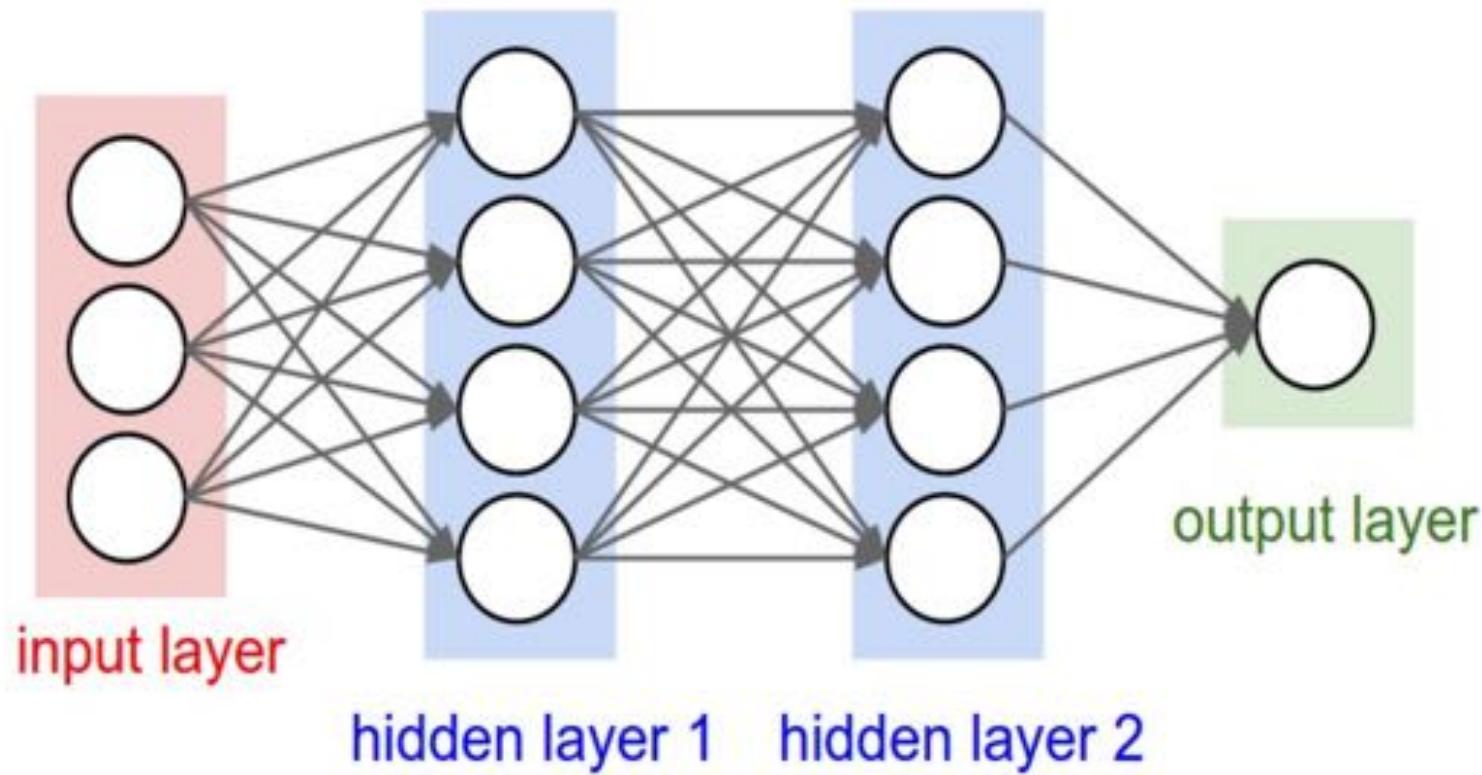

The present slides are mainly based on slides from John Canny

Last time ...

Convnets I with Alyosha Efros

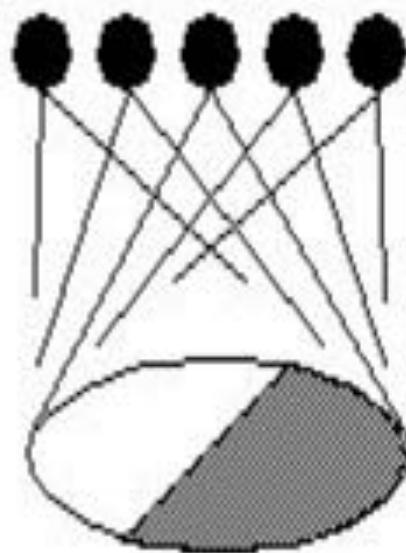

Neural Networks for Visual Data

Retinal Cells

Hubel & Weisel

topographical mapping

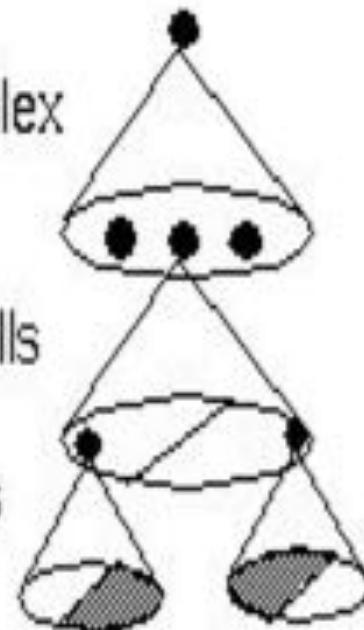

featural hierarchy

hyper-complex
cells

complex cells

simple cells

high level

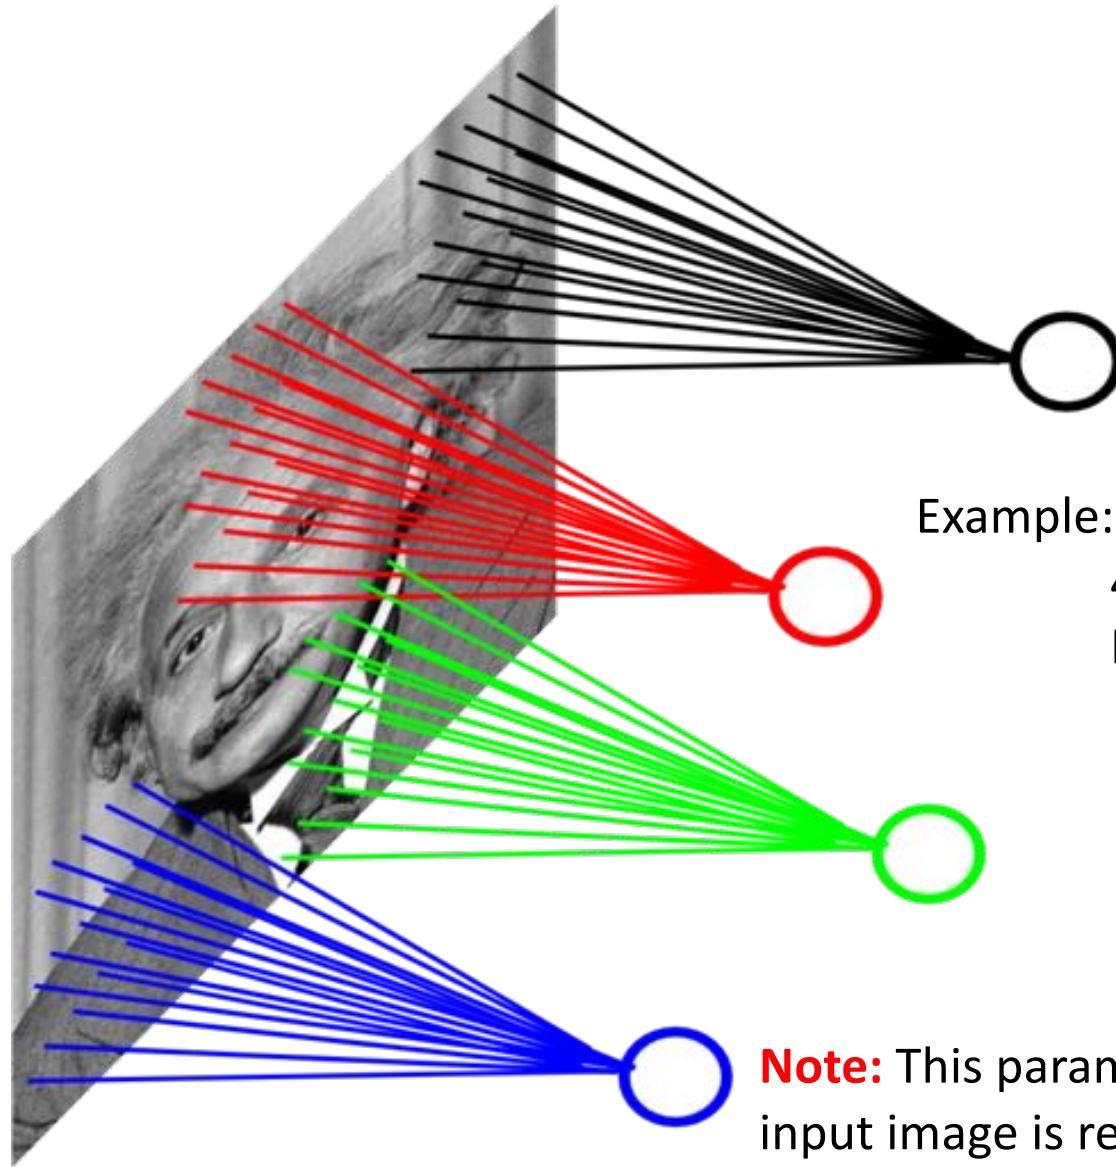

mid level

low level

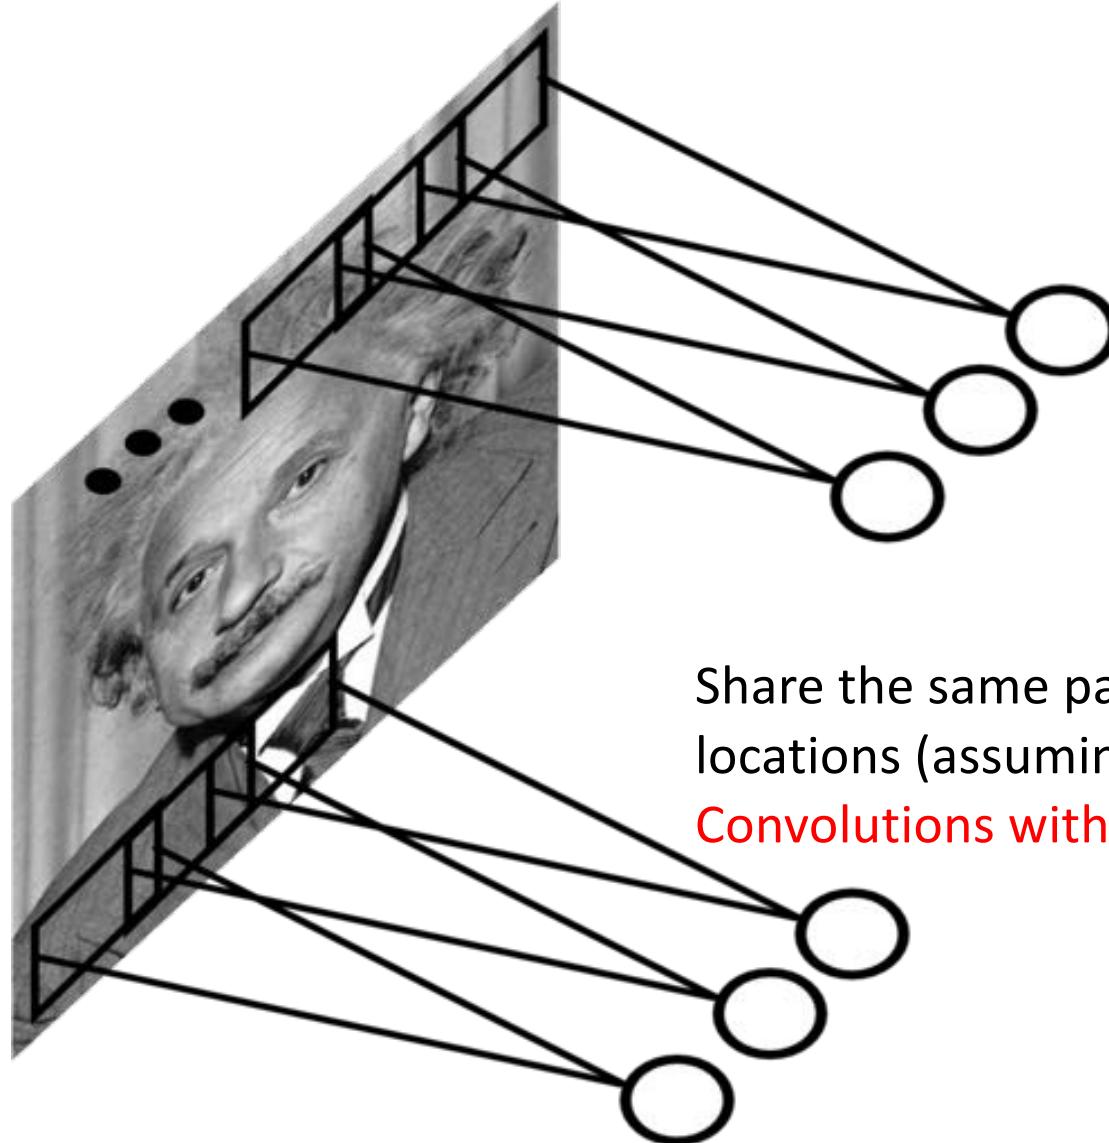

Locally Connected Layer

Example: 200x200 image
40K hidden units
Filter size: 10x10
4M parameters

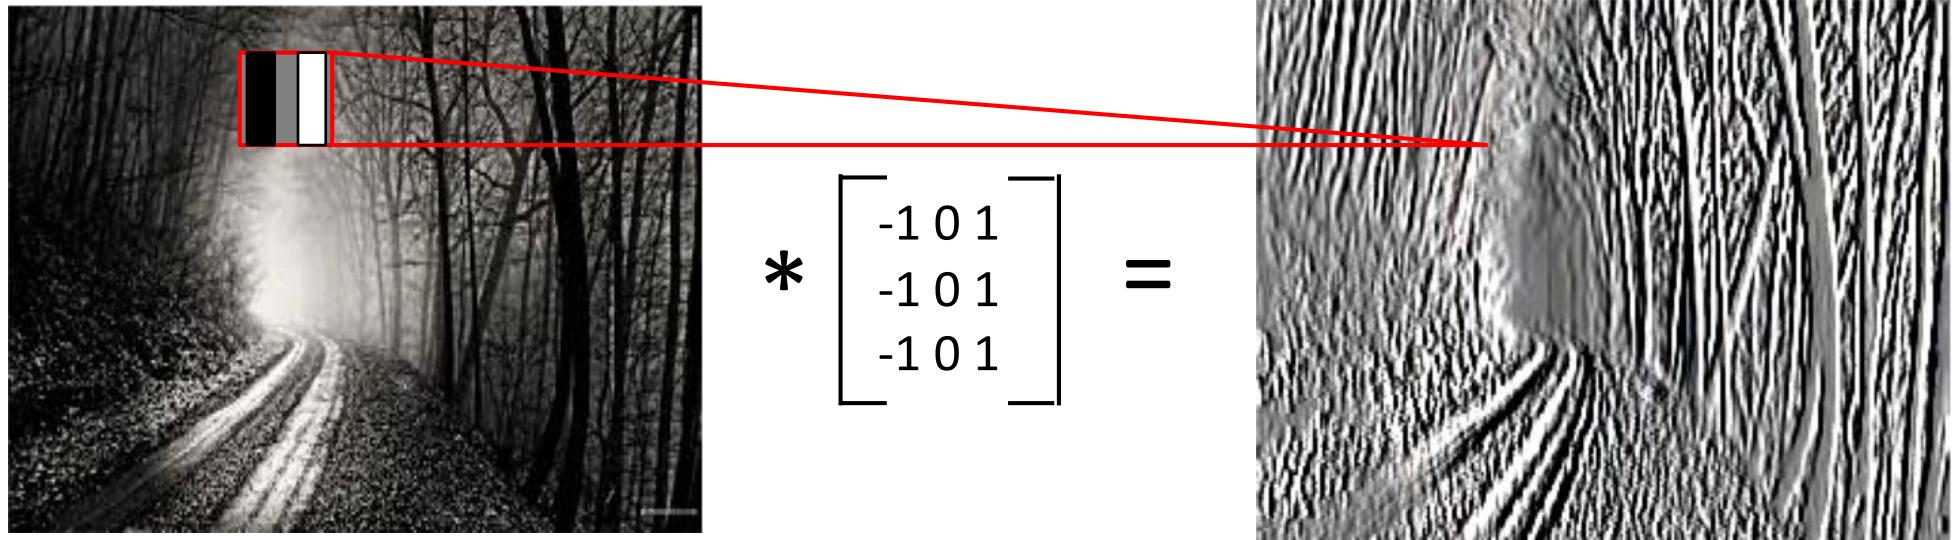

Note: This parameterization is good when input image is registered (e.g., face recognition).

Convolutional Layer

Share the same parameters across different locations (assuming input is stationary):
Convolutions with learned kernels

Convolutional of Two Signals

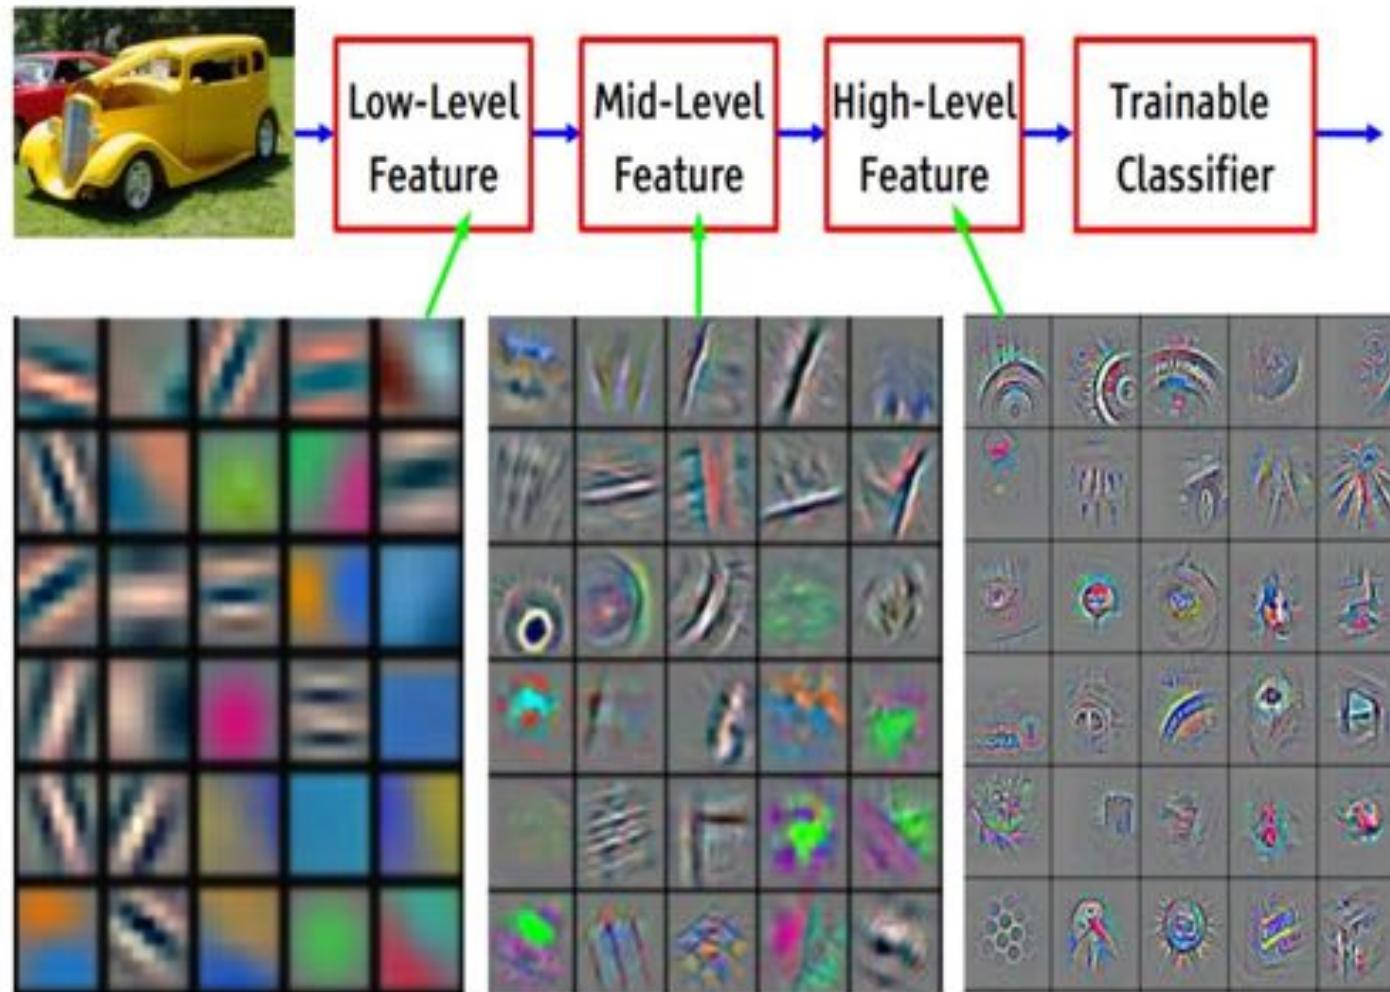

$$f[x,y] * g[x,y] = \sum_{n_1=-\infty}^{\infty} \sum_{n_2=-\infty}^{\infty} f[n_1, n_2] \cdot g[x - n_1, y - n_2]$$

elementwise multiplication and sum of a filter and the signal (image)

A Deep Classification Network

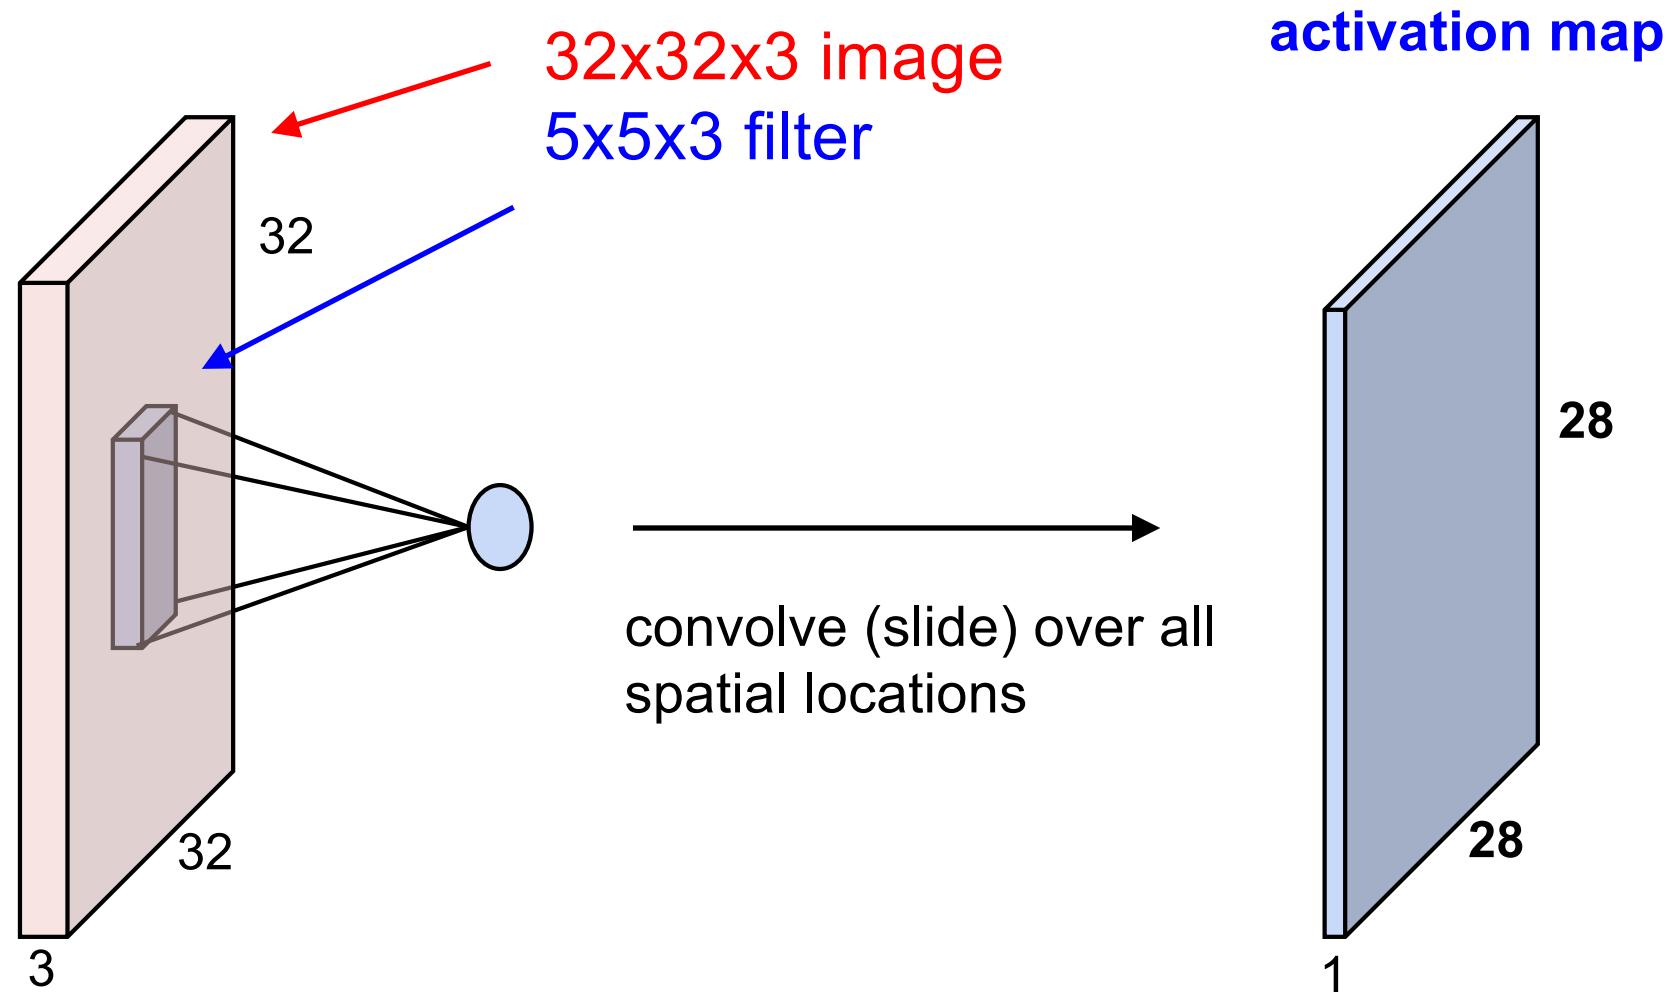

[From recent Yann LeCun slides]

Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

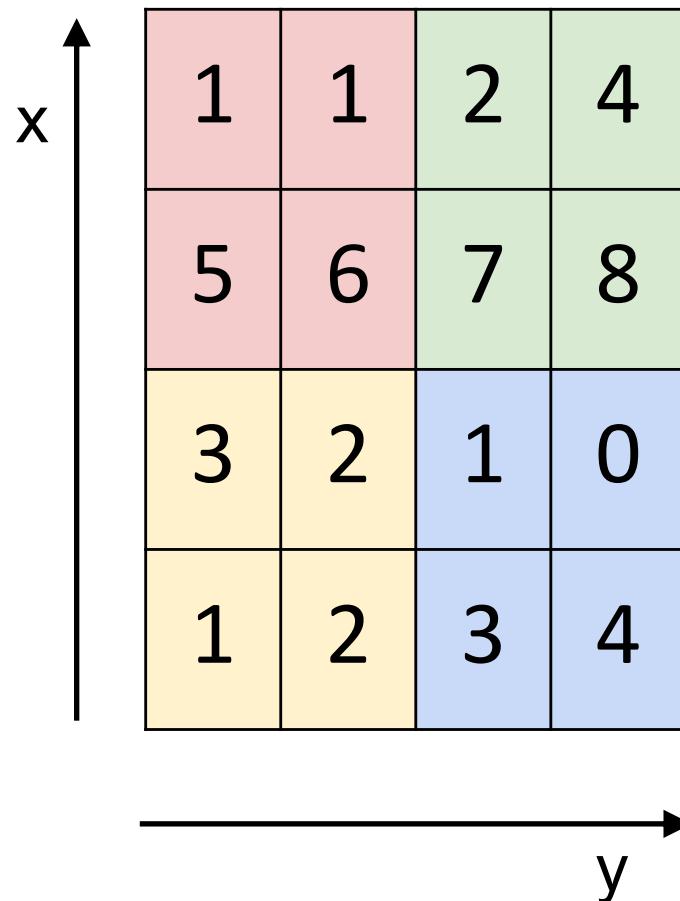

A closer look at spatial dimensions:

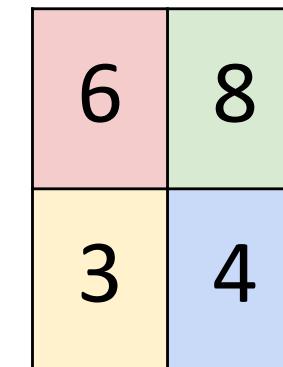

MAX POOLING

Single depth slice

max pool with 2x2 filters
and stride 2

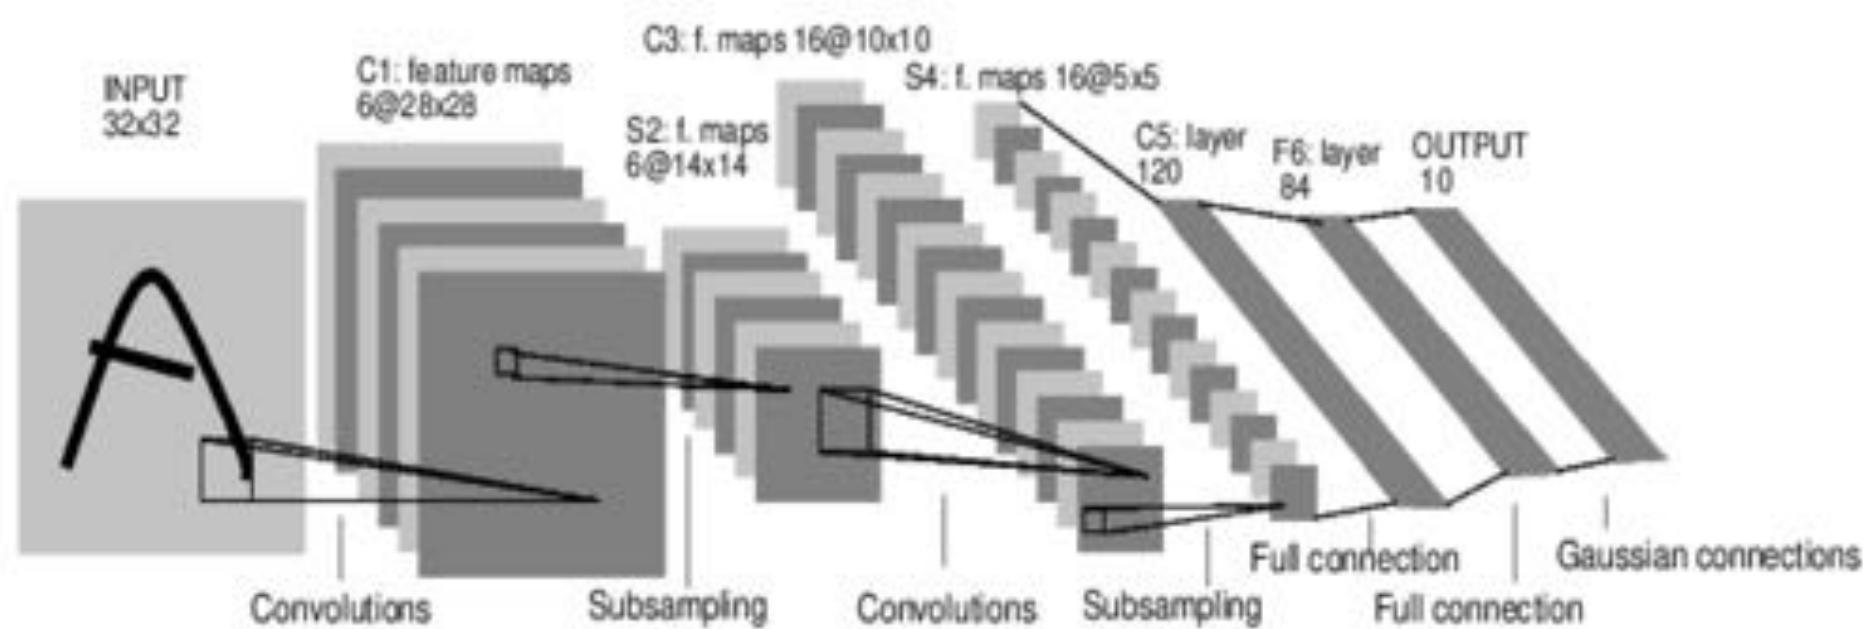

6	8
3	4

Case Study: LeNet-5

[LeCun et al., 1998]

Conv filters were 5×5 , applied at stride 1

Subsampling (Pooling) layers were 2×2 applied at stride 2

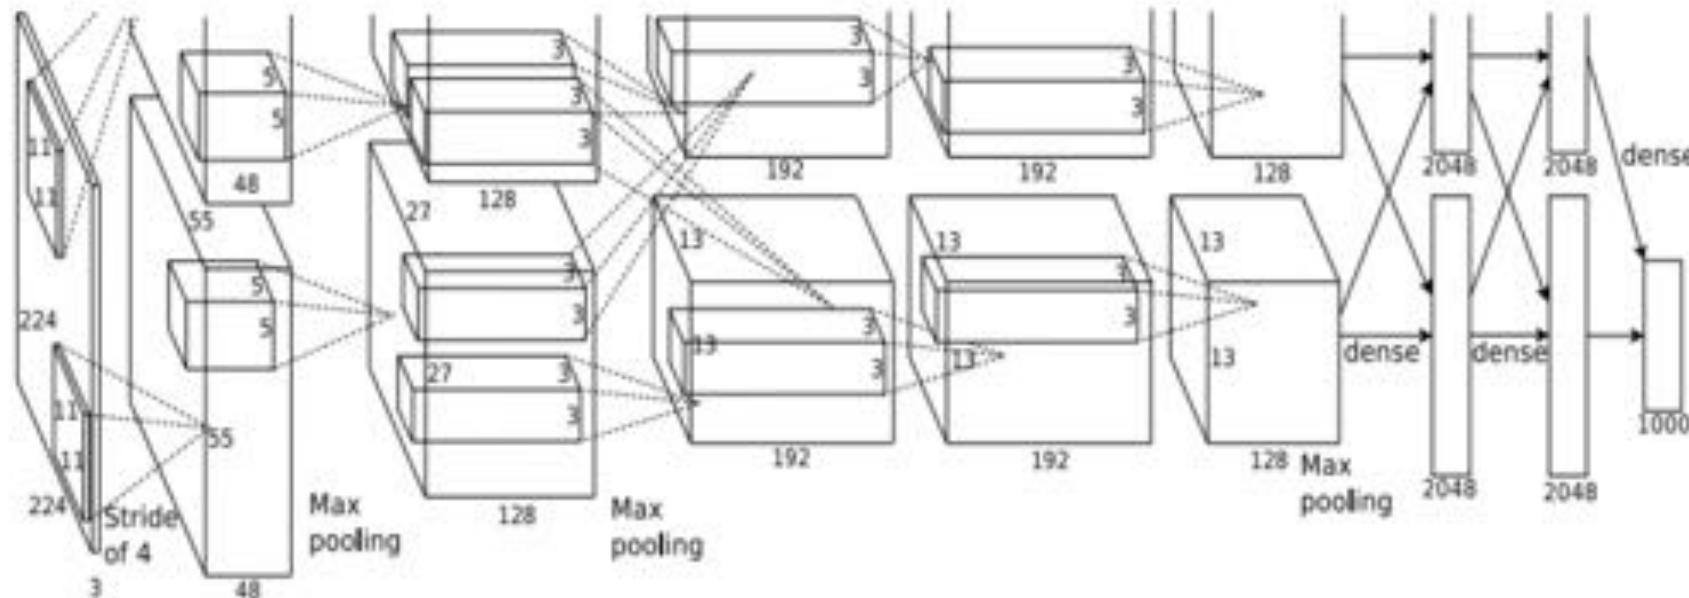

Tanh nonlinearities applied to filter outputs

i.e. architecture is [CONV-POOL-CONV-POOL-FC-FC]

Case Study: AlexNet

[Krizhevsky et al. 2012]

Input: 227x227x3 images

Case Study: AlexNet

[Krizhevsky et al. 2012]

Full (simplified) AlexNet architecture:

[227x227x3] INPUT

[55x55x96] CONV1: 96 11x11 filters at stride 4, pad 0

[27x27x96] MAX POOL1: 3x3 filters at stride 2

[27x27x96] NORM1: Normalization layer

[27x27x256] CONV2: 256 5x5 filters at stride 1, pad 2

[13x13x256] MAX POOL2: 3x3 filters at stride 2

[13x13x256] NORM2: Normalization layer

[13x13x384] CONV3: 384 3x3 filters at stride 1, pad 1

[13x13x384] CONV4: 384 3x3 filters at stride 1, pad 1

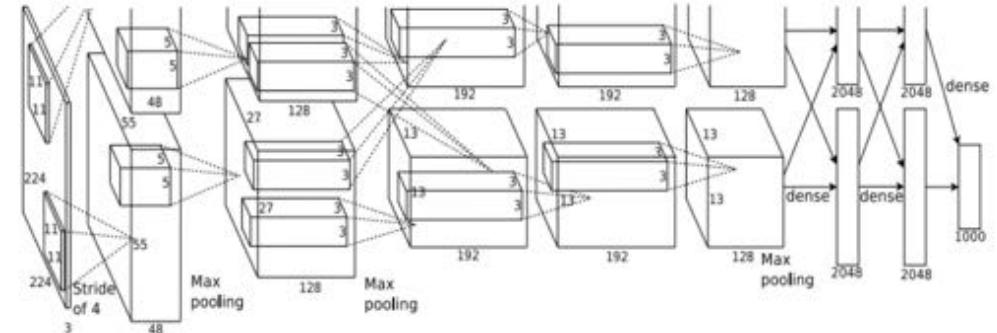

[13x13x256] CONV5: 256 3x3 filters at stride 1, pad 1

[6x6x256] MAX POOL3: 3x3 filters at stride 2

[4096] FC6: 4096 neurons

[4096] FC7: 4096 neurons

[1000] FC8: 1000 neurons (class scores)

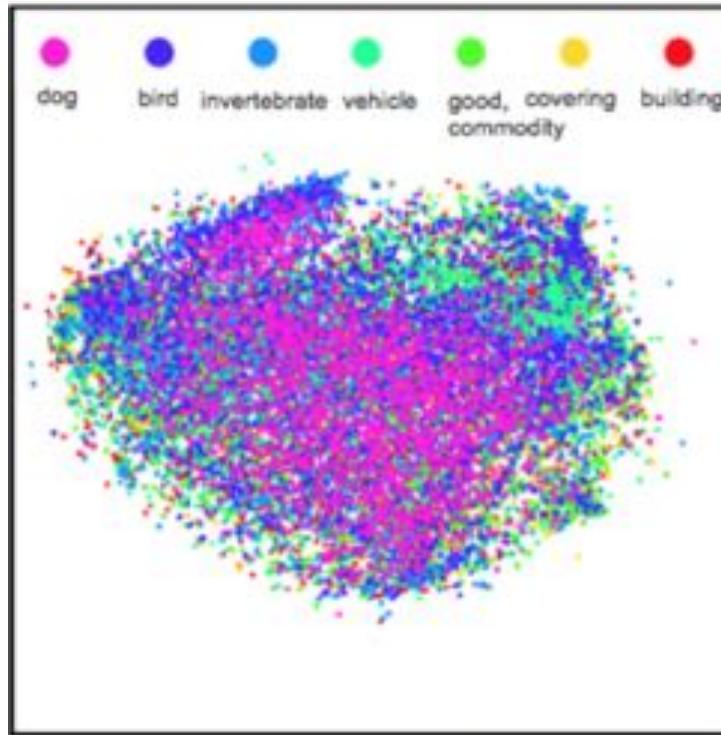

Details/Retrospectives:

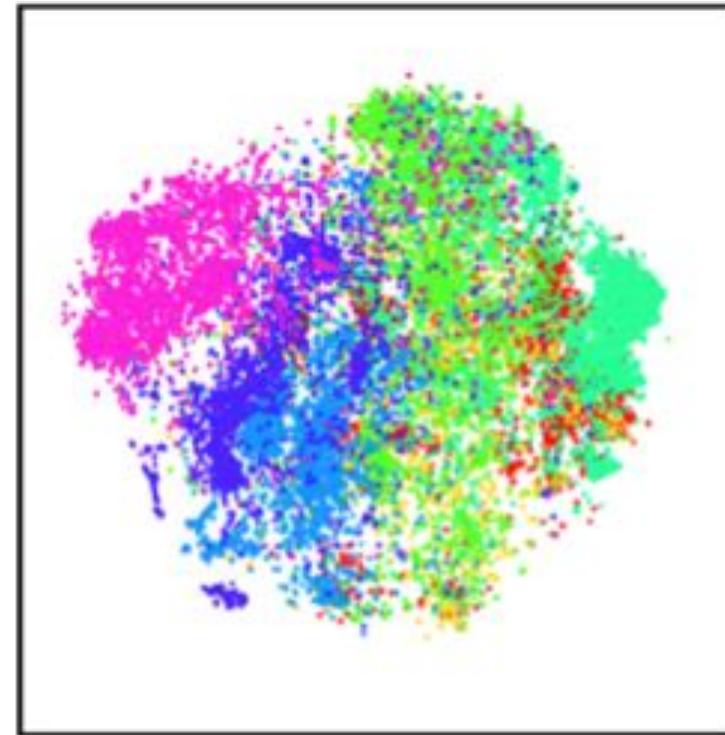

- first use of ReLU
- used Norm layers (not common anymore)
- heavy data augmentation
- dropout 0.5
- batch size 128
- SGD Momentum 0.9
- Learning rate 1e-2, reduced by 10 manually when val accuracy plateaus
- L2 weight decay 5e-4
- 7 CNN ensemble: 18.2% -> 15.4%

The Unreasonable Effectiveness of Deep Features

Low-level: Pool₁

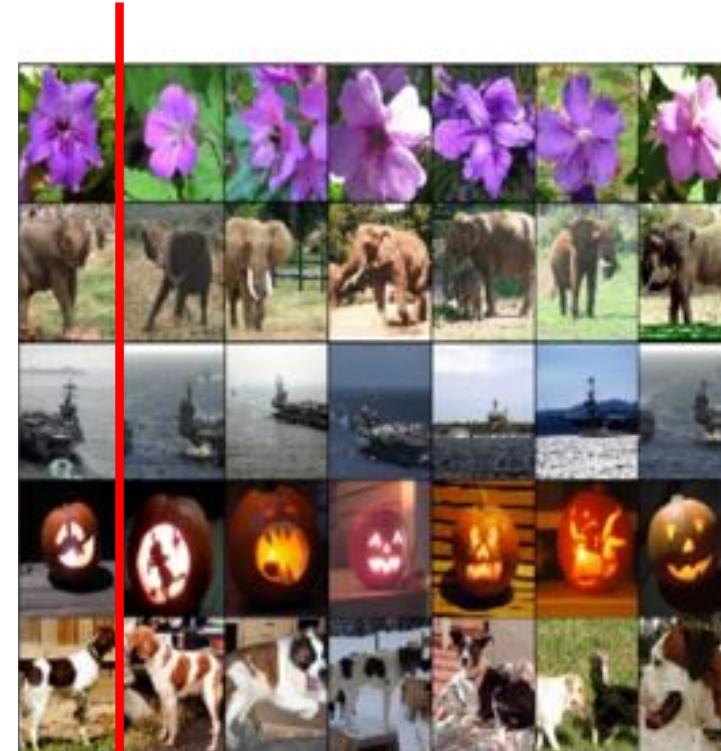

High-level: FC₆

Classes separate in the deep representations and transfer to many tasks. [DeCAF] [Zeiler-Fergus]

Can be used as a generic feature

("CNN code" = 4096-D vector before classifier)

query image

nearest neighbors in the "code" space

Transfer Learning with CNNs

Transfer Learning with CNNs

1. Train on
Imagenet

2. If small dataset: fix
all weights (treat CNN
as fixed feature
extractor), retrain only
the classifier

i.e. swap the Softmax
layer at the end

3. If you have medium sized
dataset, “**finetune**”
instead: use the old weights
as initialization, train the full
network or only some of the
higher layers

retrain bigger portion of the
network, or even all of it.

Transfer Learning with CNNs

1. Train on
Imagenet

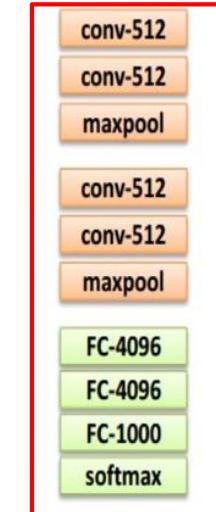

2. If small dataset: fix
all weights (treat CNN
as fixed feature
extractor), retrain only
the classifier

i.e. swap the Softmax
layer at the end

3. If you have medium sized
dataset, “**finetune**”
instead: use the old weights
as initialization, train the full
network or only some of the
higher layers

retrain bigger portion of the
network, or even all of it.

tip: use only ~1/10th of

Fun features:

- Only 5 million params!
(Removes FC layers completely)

Compared to AlexNet:

- 12X less params
- 2x more compute
- 6.67% (vs. 16.4%)

Case Study: ResNet

[He et al., 2015]

ILSVRC 2015 winner (3.6% top 5 error)

Microsoft Research

MSRA @ ILSVRC & COCO 2015 Competitions

- **1st places in all five main tracks**
 - ImageNet Classification: “Ultra-deep” (quote Yann) **152-layer nets**
 - ImageNet Detection: **16%** better than 2nd
 - ImageNet Localization: **27%** better than 2nd
 - COCO Detection: **11%** better than 2nd
 - COCO Segmentation: **12%** better than 2nd

*improvements are relative numbers

Classification + Localization: Task

Classification: C classes

Input: Image

Output: Class label

Evaluation metric: Accuracy

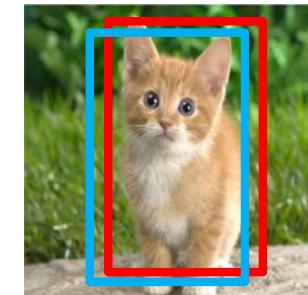

CAT

Localization:

Input: Image

Output: Box in the image (x, y, w, h)

Evaluation metric: Intersection over Union

(x, y, w, h)

Classification + Localization: Do both

Classification + Localization: ImageNet

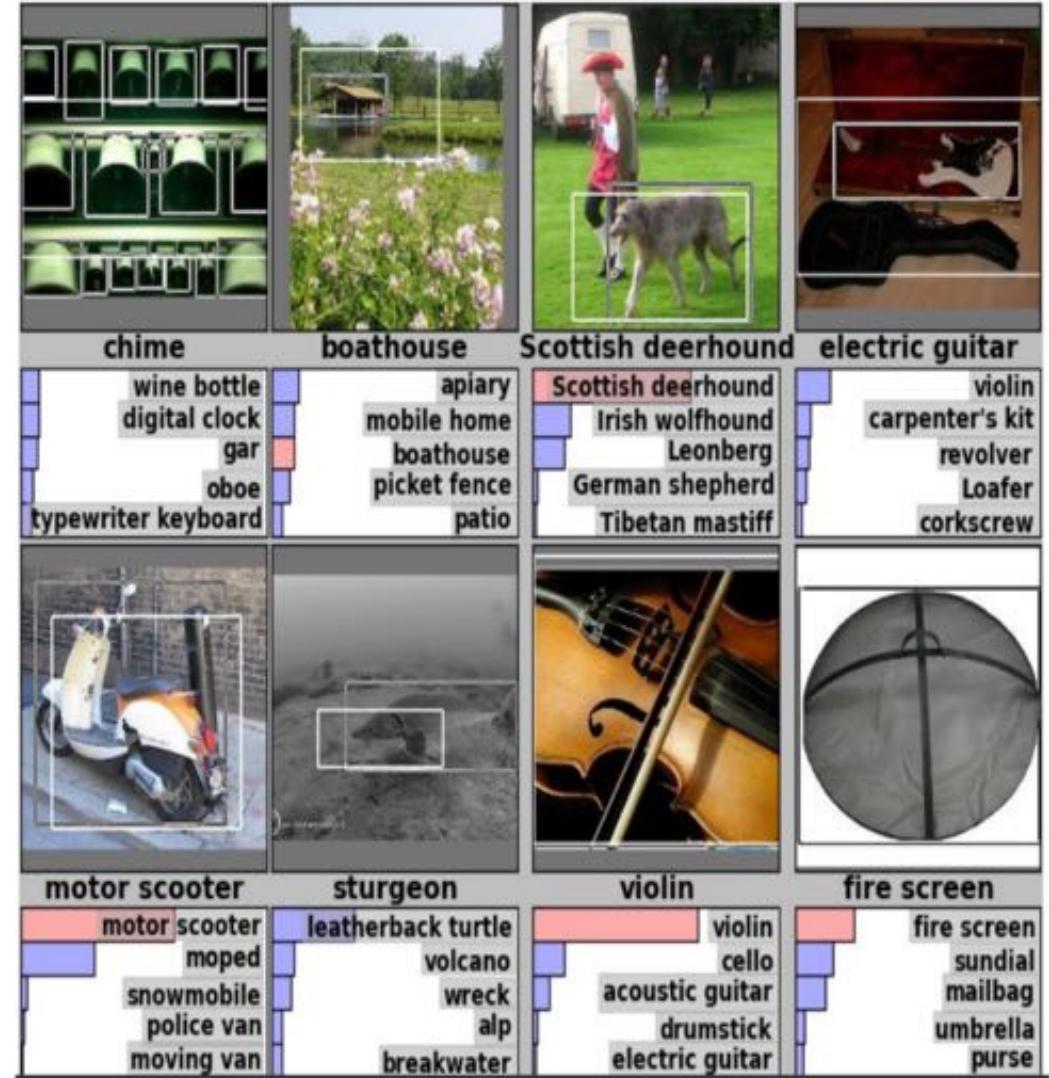

1000 classes (same as classification)

Each image has 1 class, at least one bounding box

~800 training images per class

Algorithm produces 5 (class, box) guesses

Example is correct if at least one guess has correct class AND bounding box at least 0.5 intersection over union (IoU)

Krizhevsky et. al. 2012

Idea #1: Localization as Regression

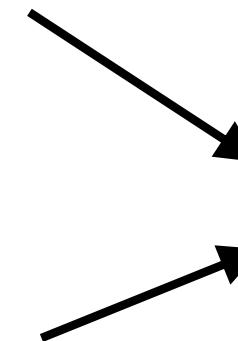

Input: image

Neural Net
→

Output:
Box coordinates
(4 numbers)

Correct output:
box coordinates
(4 numbers)

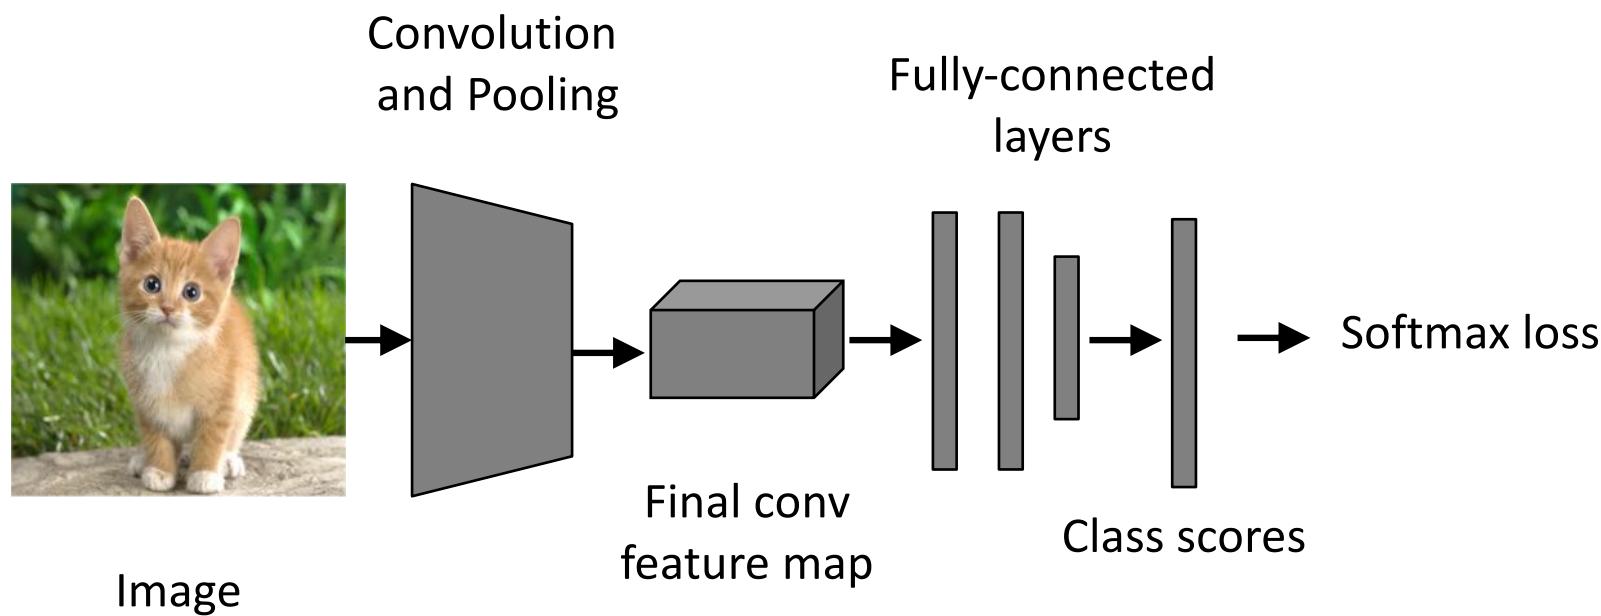

Loss:
L2 distance

Only one object,
simpler than detection

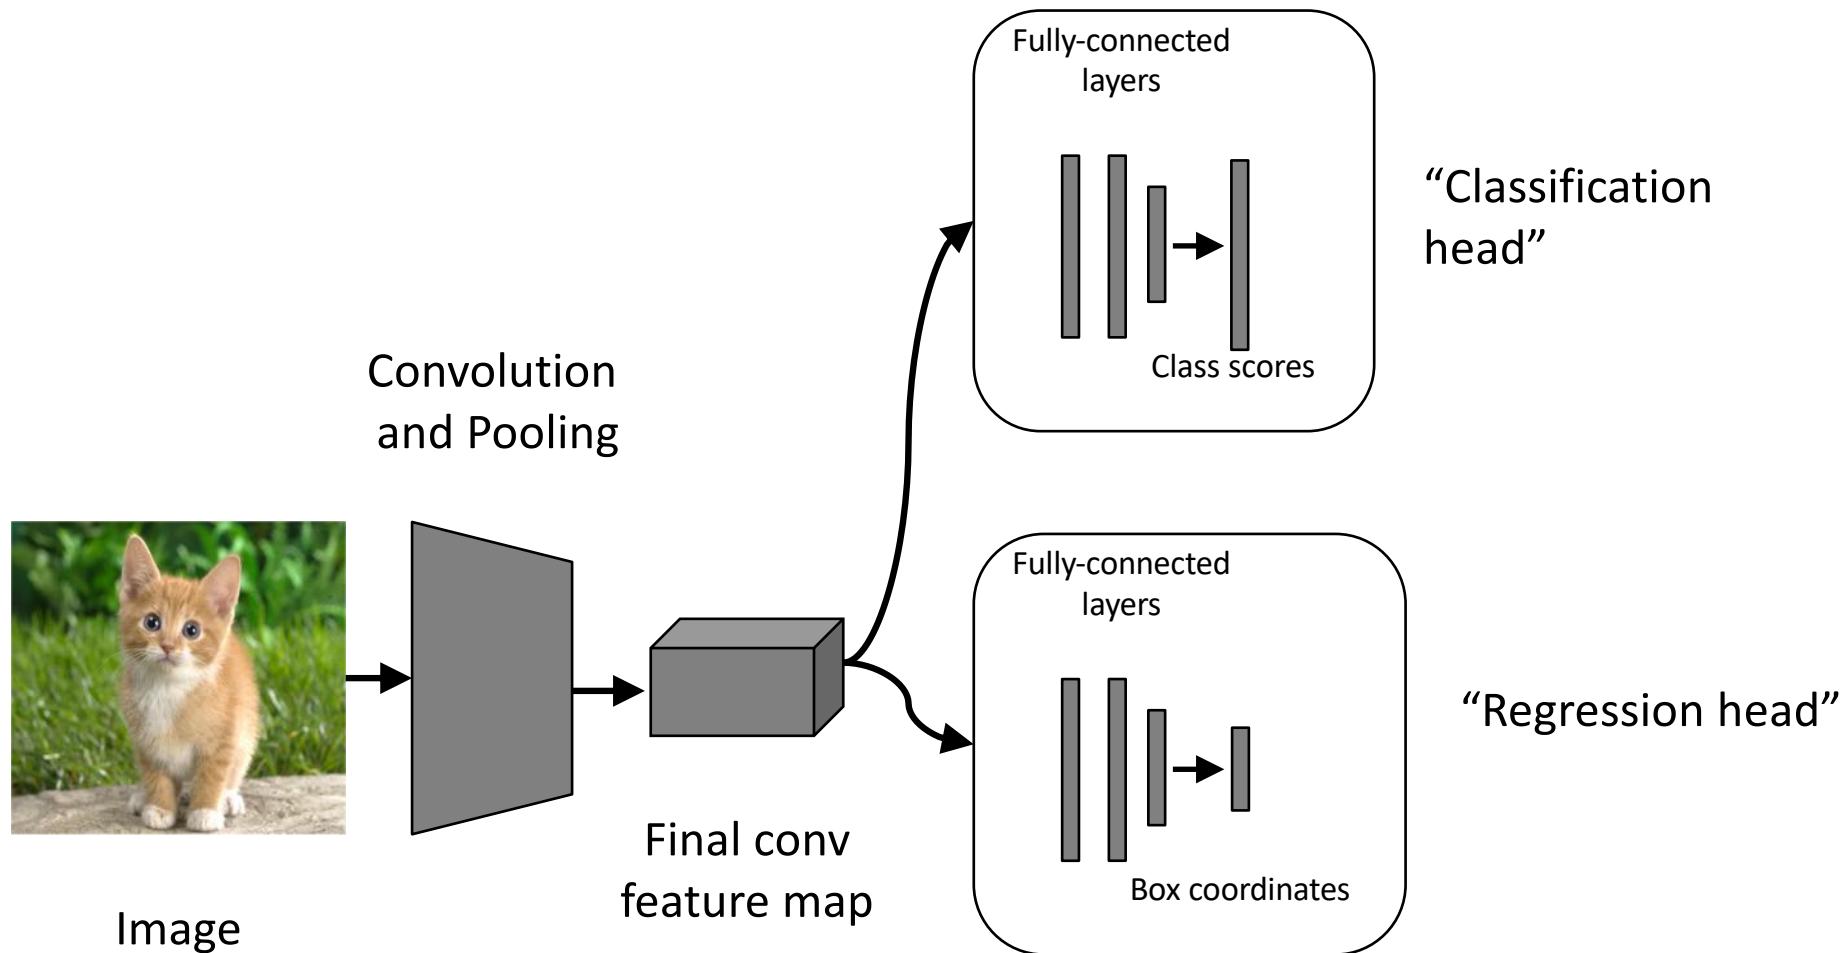

Simple Recipe for Classification + Localization

Step 1: Train (or download) a classification model (AlexNet, VGG, GoogLeNet)

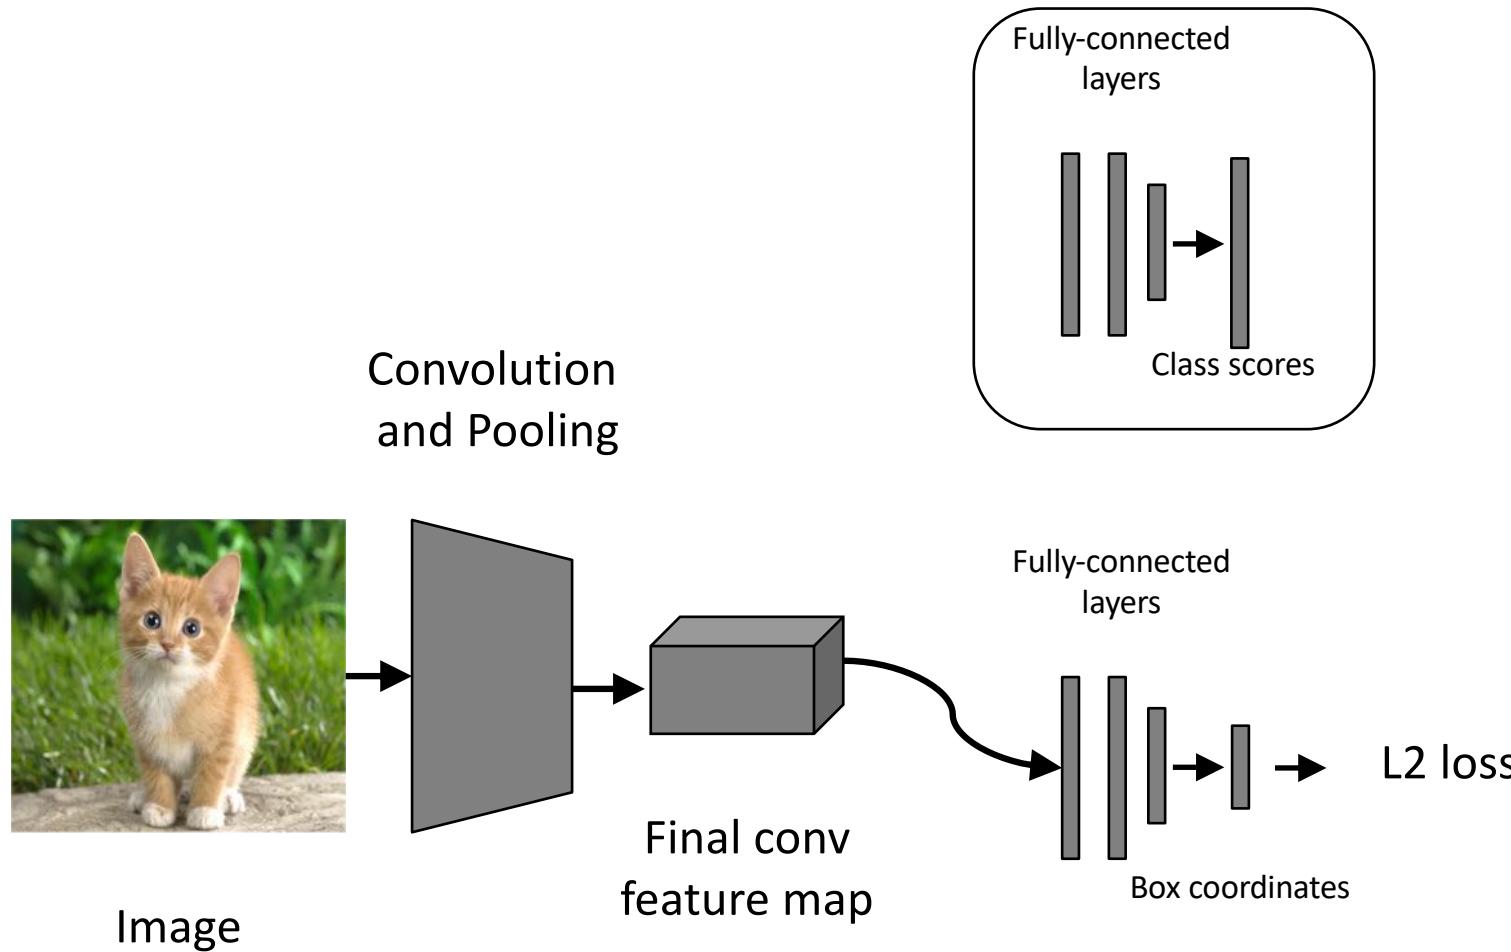

Simple Recipe for Classification + Localization

Step 2: Attach new fully-connected “regression head” to the network

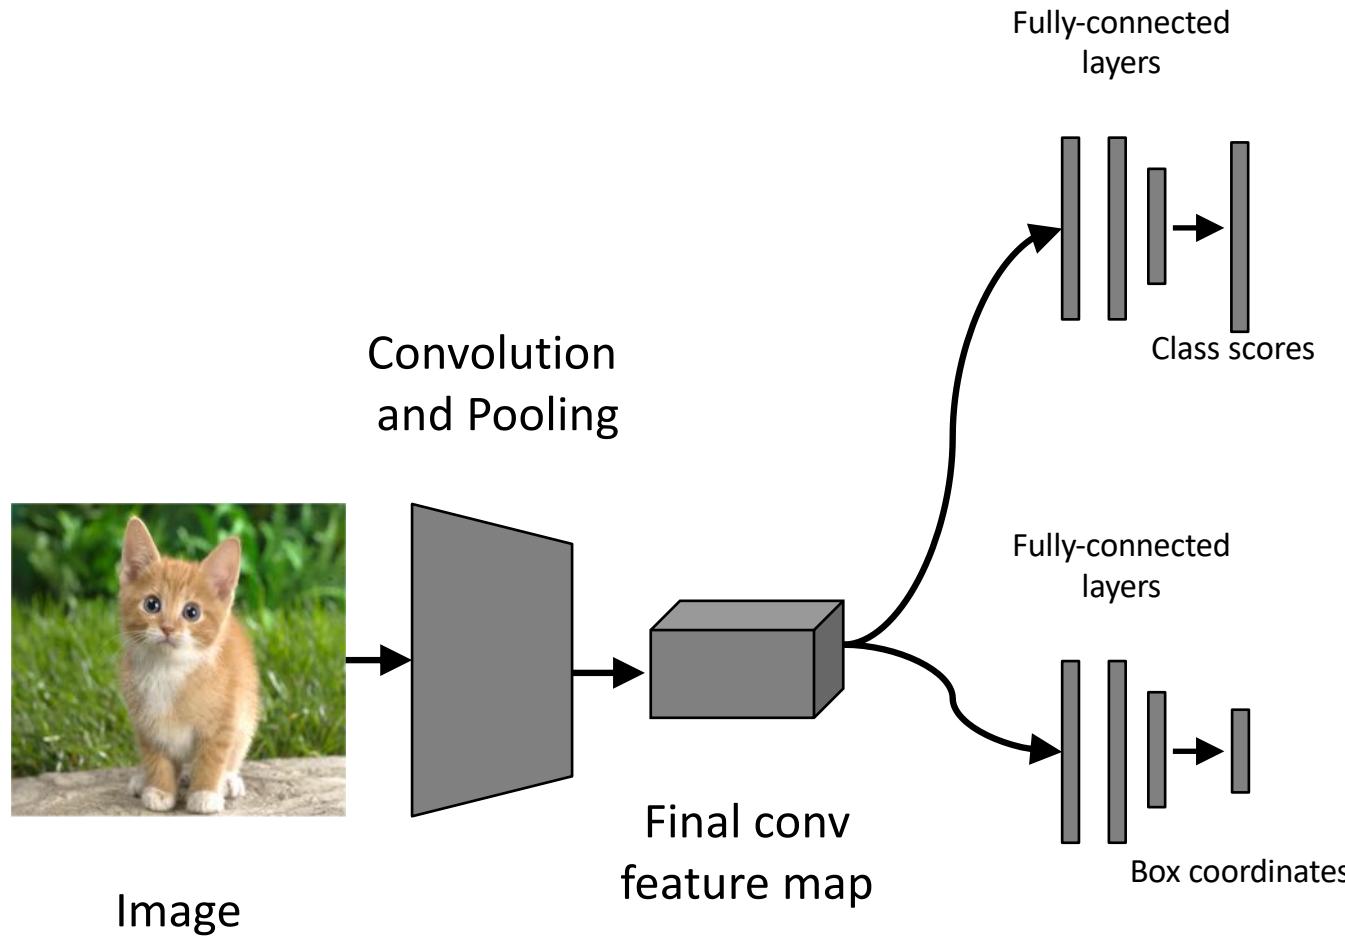

Simple Recipe for Classification + Localization

Step 3: Train the regression head only with SGD and L2 loss

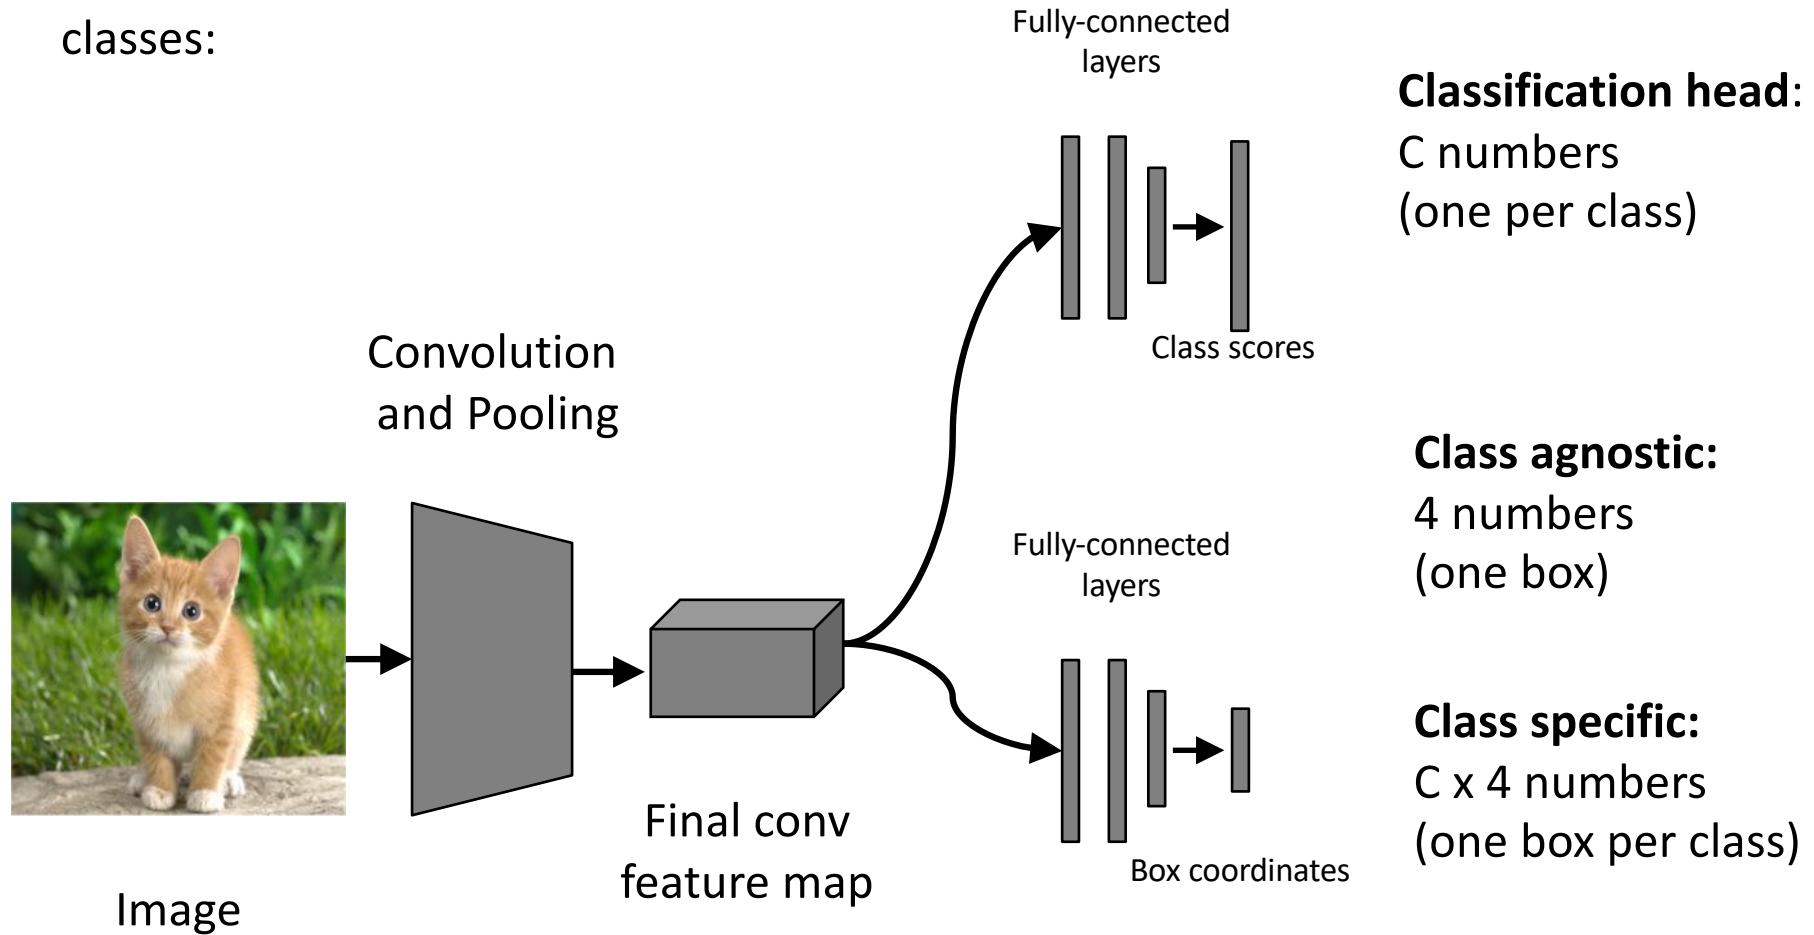

Simple Recipe for Classification + Localization

Step 4: At test time use both heads

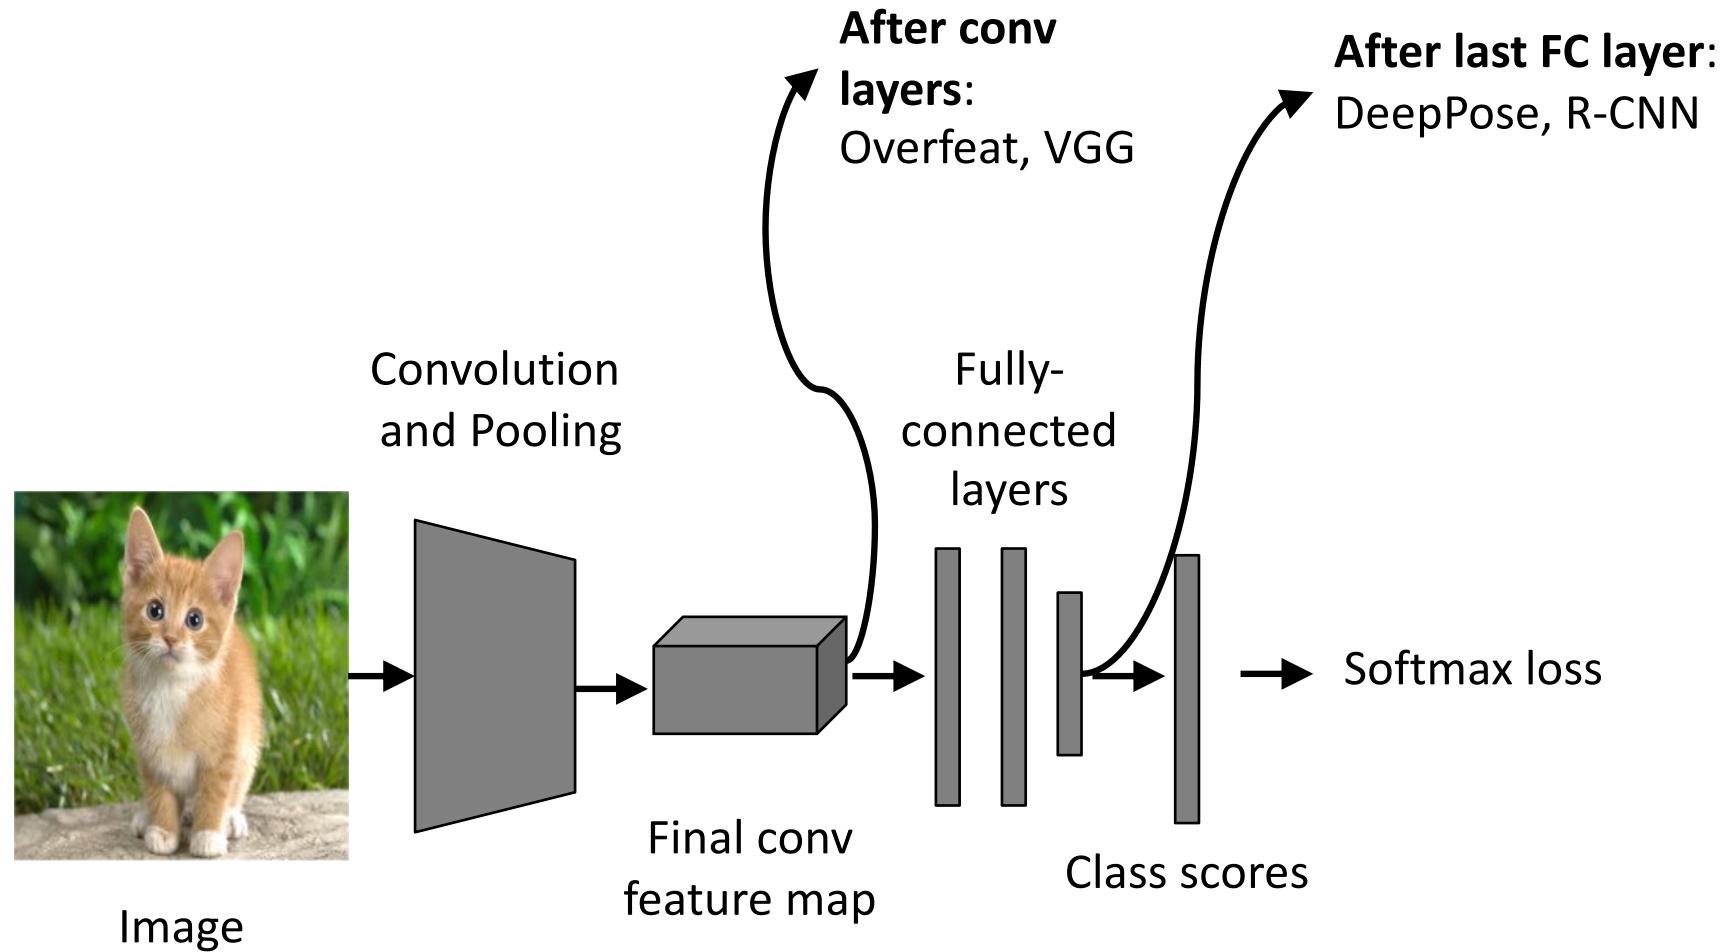

Per-class vs class agnostic regression

Assume classification over C classes:

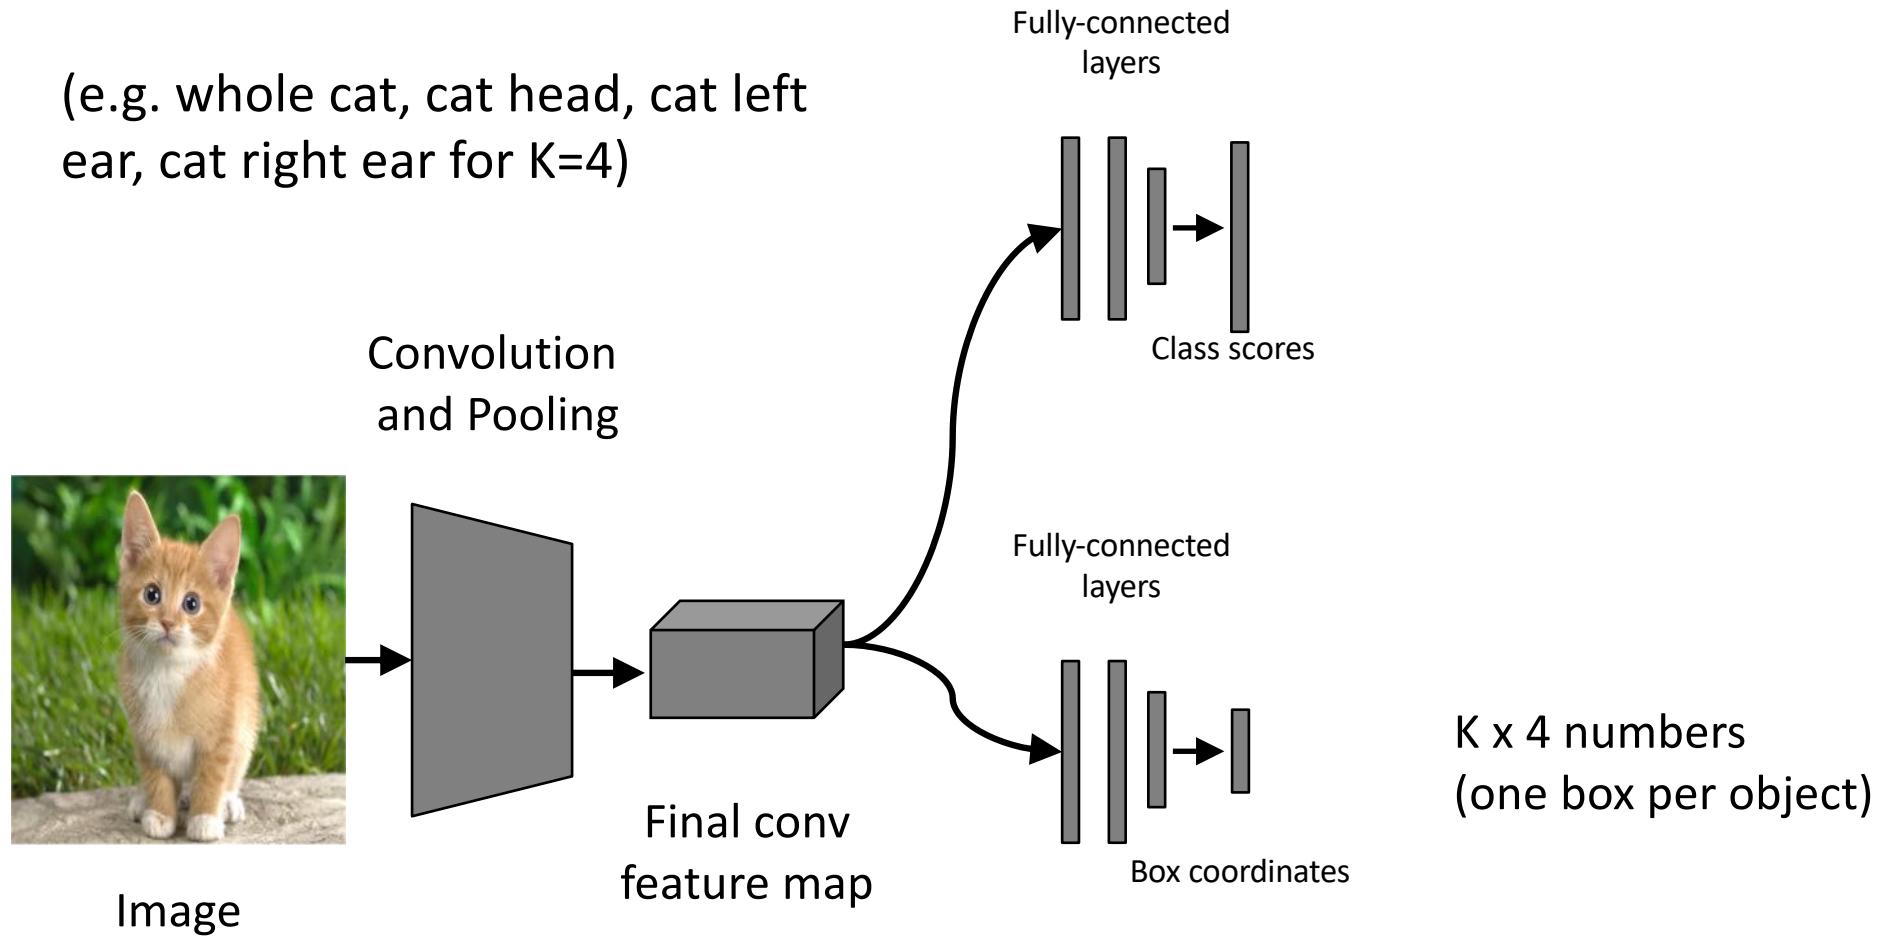

Where to attach the regression head?

Aside: Localizing multiple objects

Want to localize **exactly K** objects
in each image

(e.g. whole cat, cat head, cat left
ear, cat right ear for $K=4$)

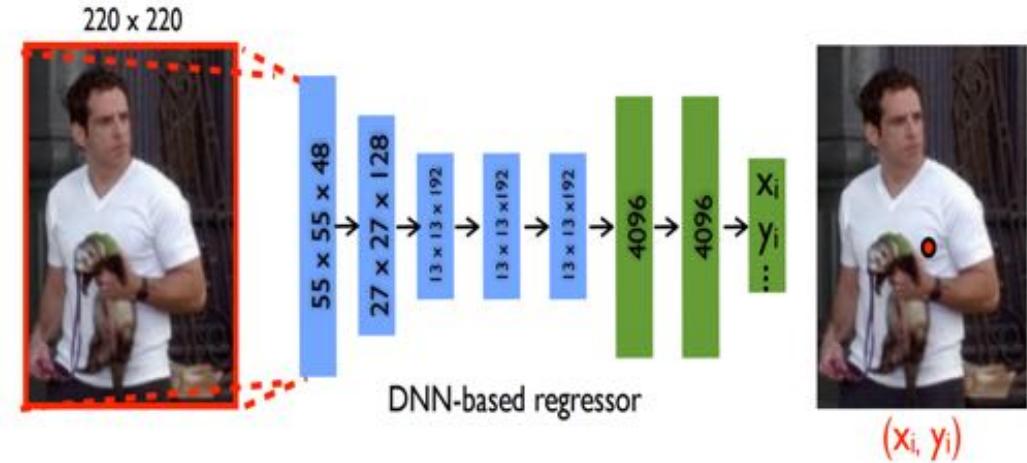

Aside: Human Pose Estimation

Represent a person by K joints

Regress (x, y) for each joint from last fully-connected layer of AlexNet

(Details: Normalized coordinates, iterative refinement)

Toshev and Szegedy, "DeepPose: Human Pose Estimation via Deep Neural Networks", CVPR 2014

Idea #2: Sliding Window

- Run classification + regression network at multiple locations on a high-resolution image
- Convert fully-connected layers into convolutional layers for efficient computation
- Combine classifier and regressor predictions across all scales for final prediction

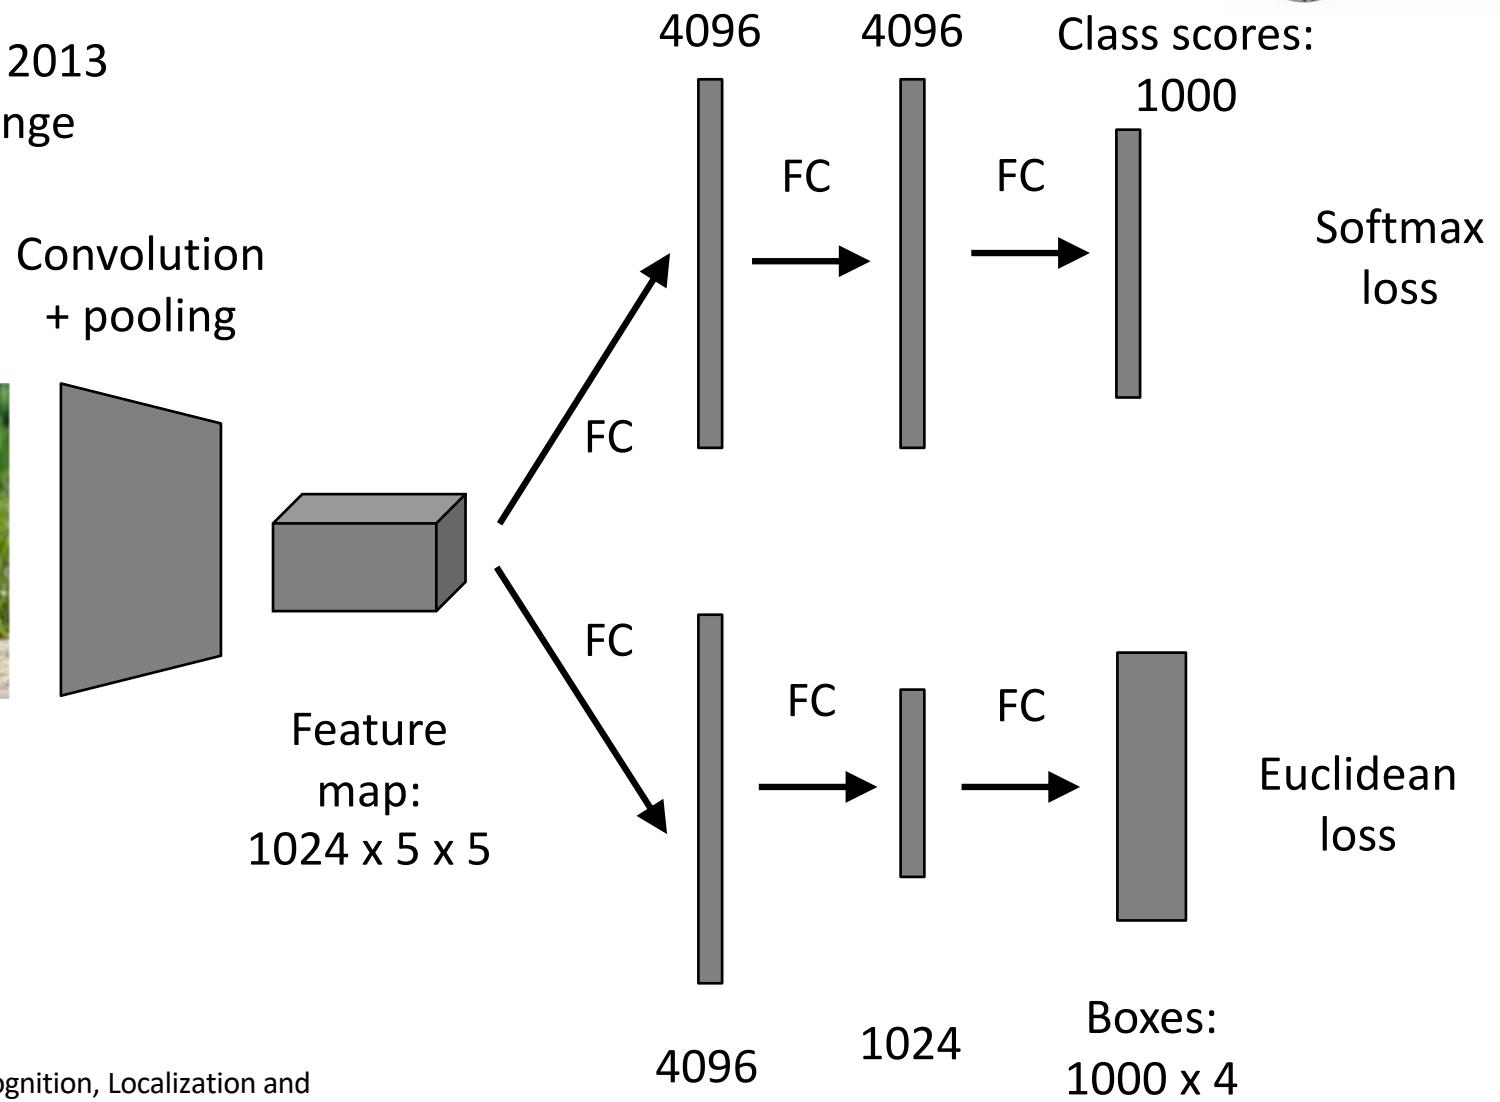

Sliding Window: Overfeat

Winner of ILSVRC 2013
localization challenge

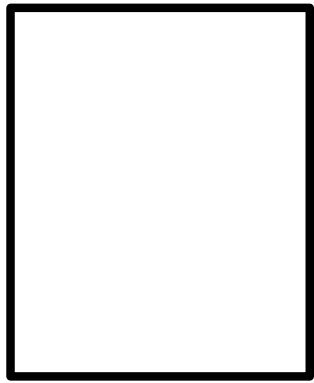

Image:
 $3 \times 221 \times 221$

Sermanet et al, "Integrated Recognition, Localization and Detection using Convolutional Networks", ICLR 2014

Sliding Window: Overfeat

input:
 $3 \times 221 \times 221$

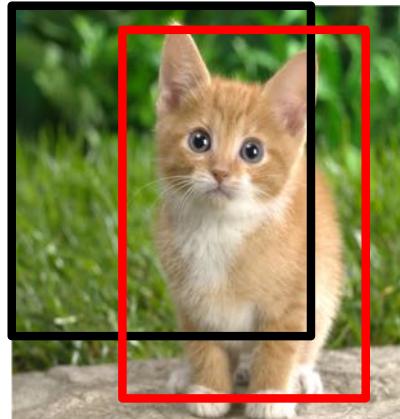

Larger image:
 $3 \times 257 \times 257$

0.8

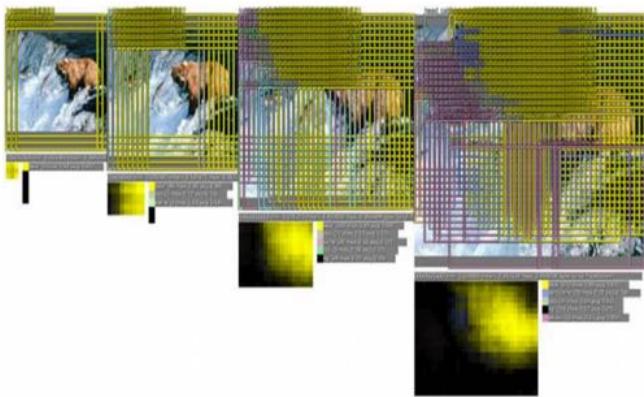

Classification
score: $P(\text{cat})$

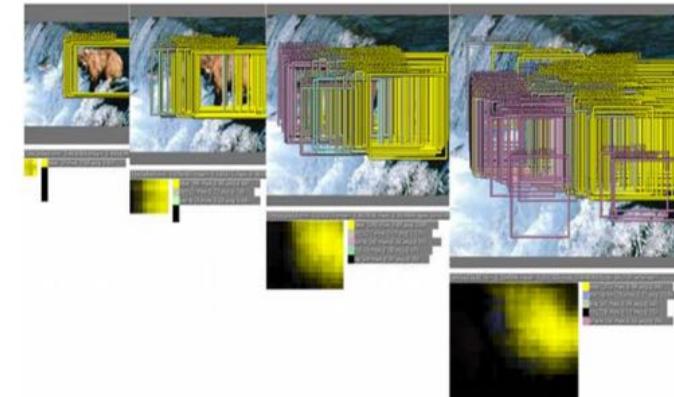

Sliding Window: Overfeat

In practice use many sliding window locations and multiple scales

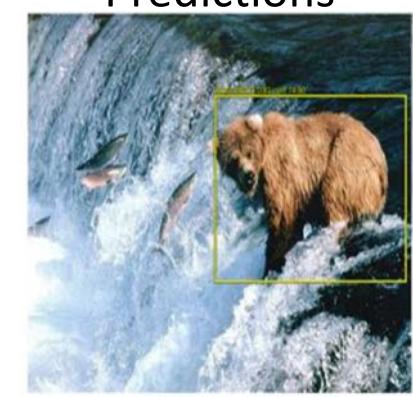

Window positions + score maps

Box regression outputs

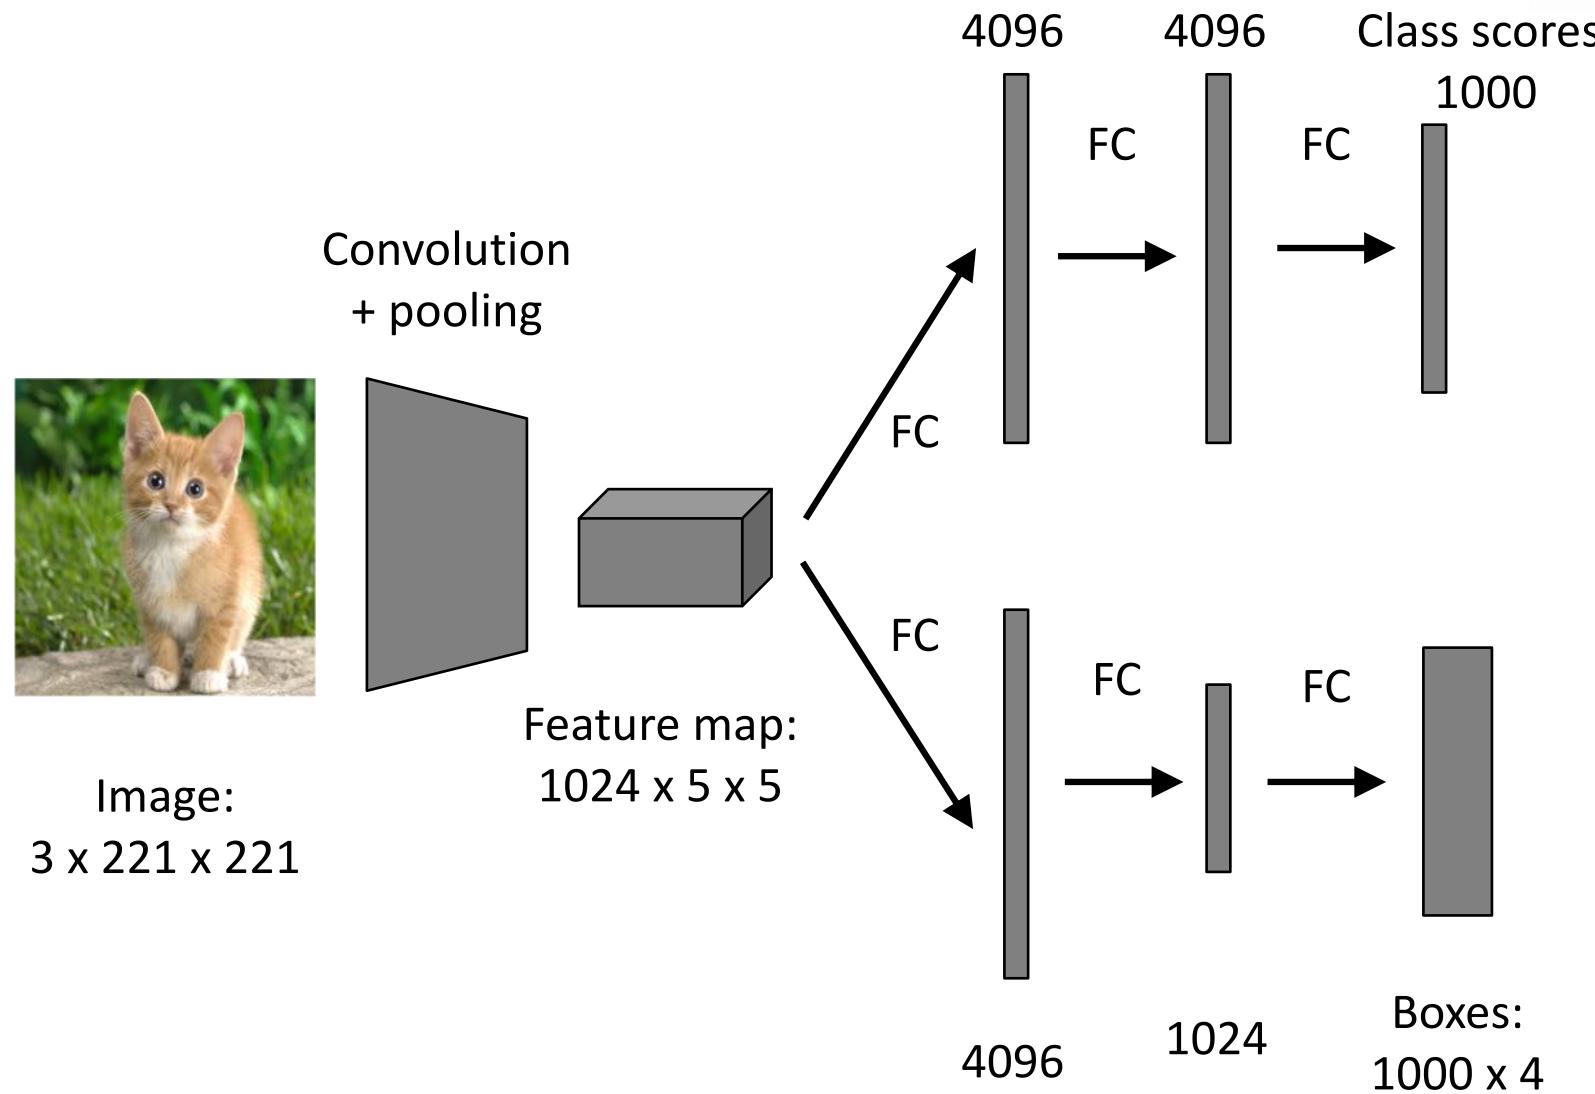

Final Predictions

Sermanet et al, "Integrated Recognition, Localization and Detection using Convolutional Networks", ICLR 2014

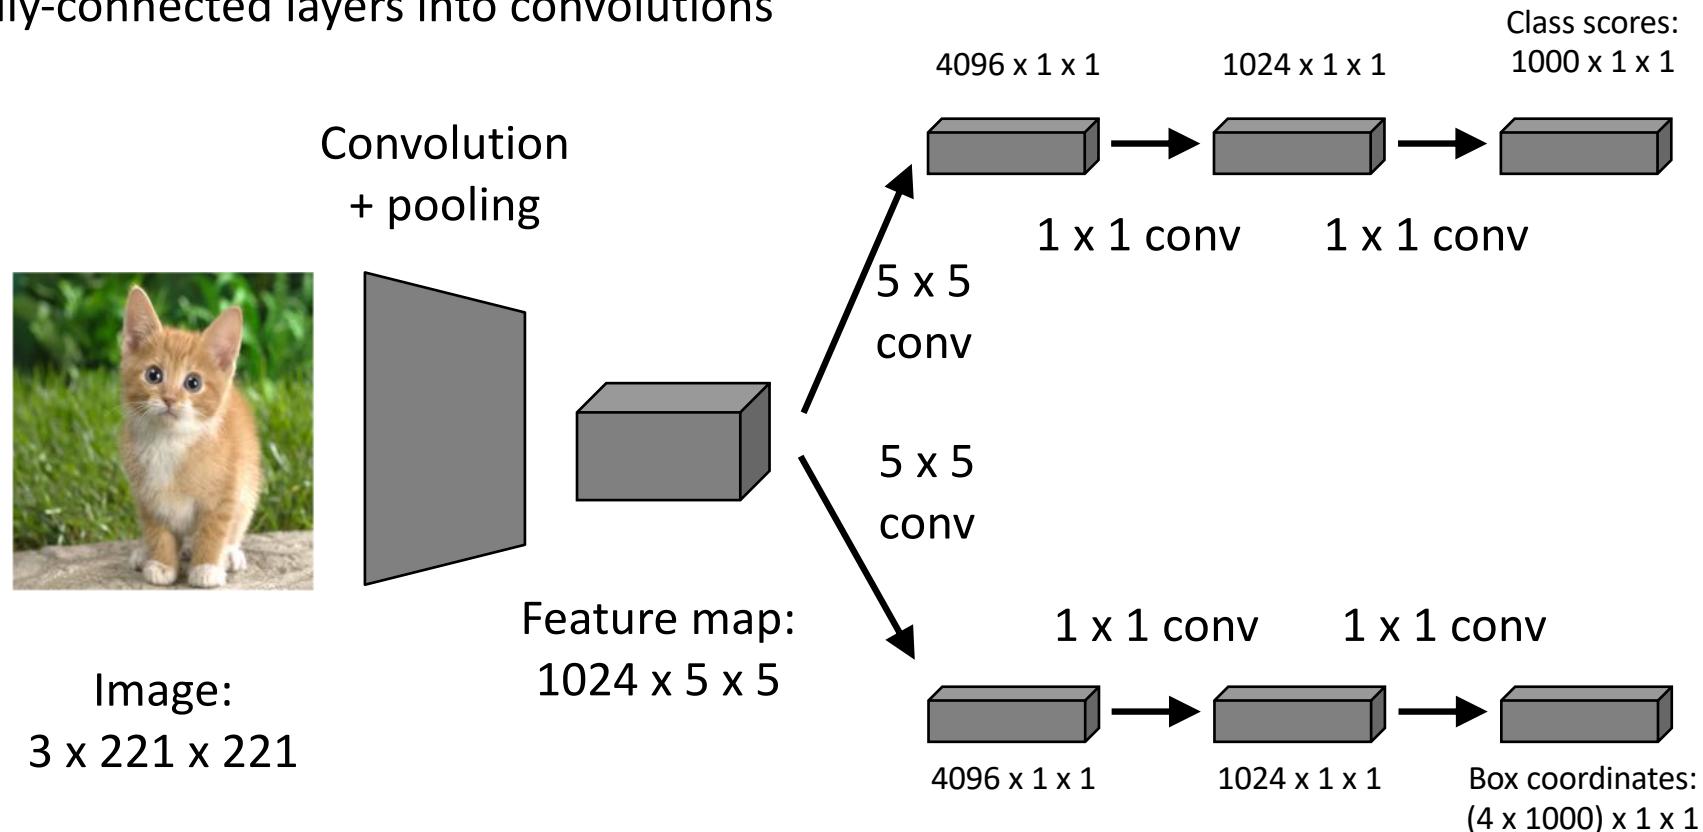

Efficient Sliding Window: Overfeat

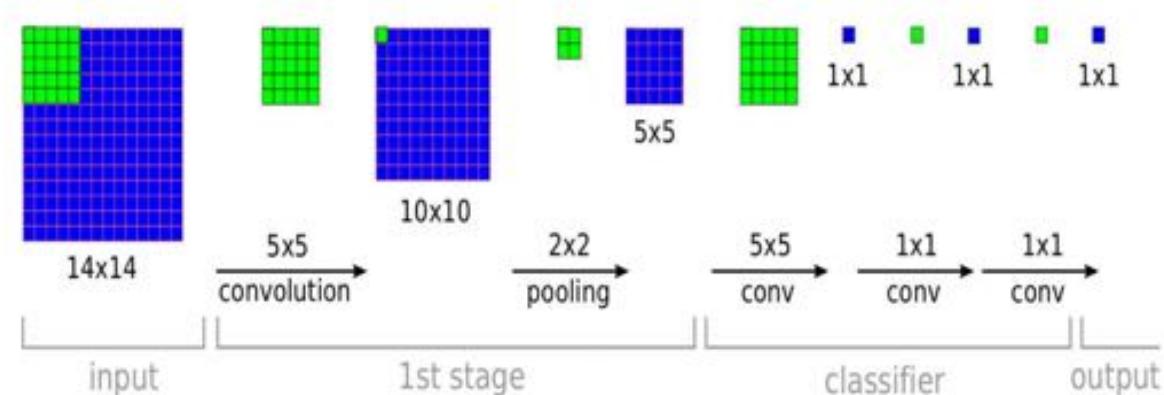

Efficient Sliding Window: Overfeat

Efficient sliding window by converting
fully-connected layers into convolutions

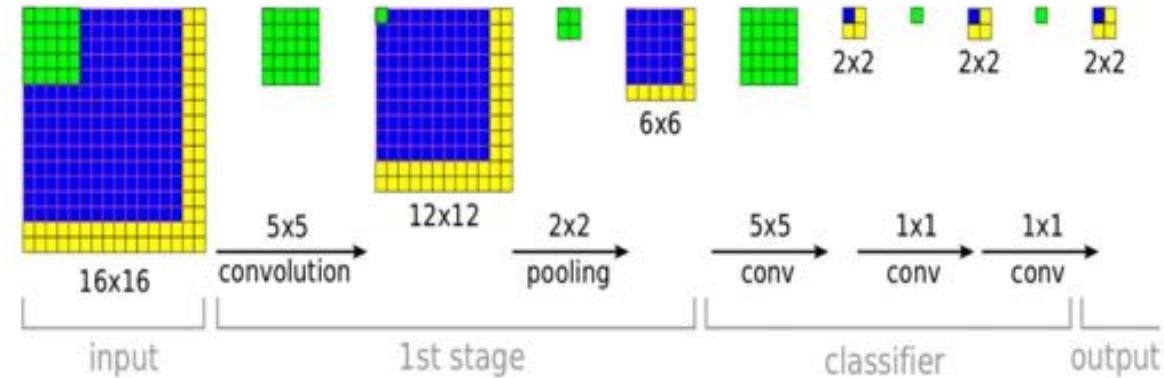

Efficient Sliding Window: Overfeat

Training time: Small image,
 1×1 classifier output

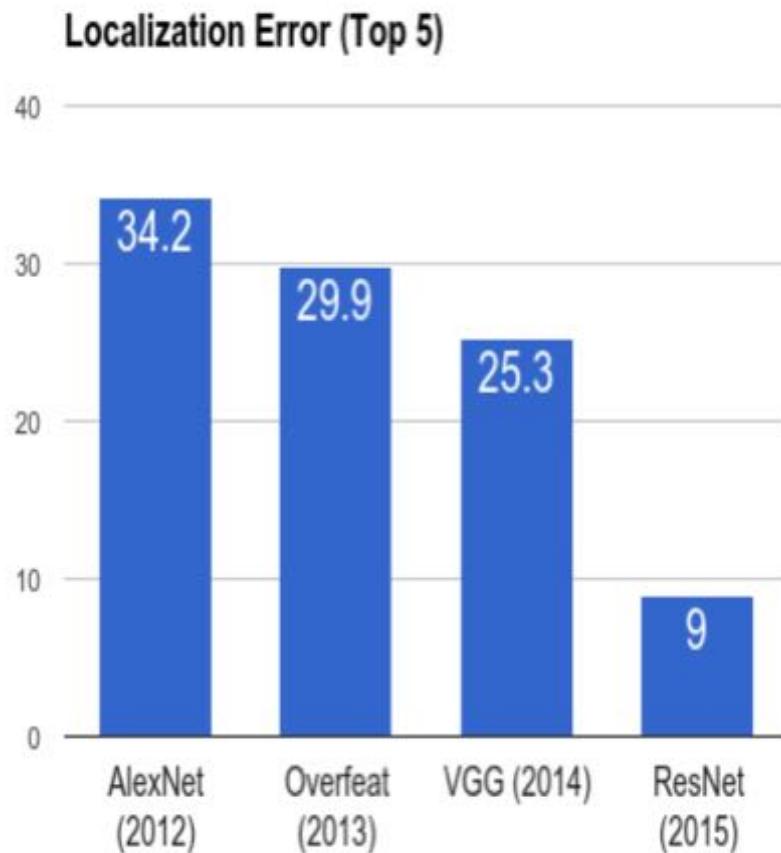

Test time: Larger image, 2×2 classifier output, only extra compute at yellow regions

Sermanet et al, "Integrated Recognition, Localization and Detection using Convolutional Networks", ICLR 2014

ImageNet Classification + Localization

AlexNet: Localization method not published

Overfeat: Multiscale convolutional regression with box merging

VGG: Same as Overfeat, but fewer scales and locations; simpler method, gains all due to deeper features

ResNet: Different localization method (RPN) and much deeper features

Slide credit: Ross Girshick

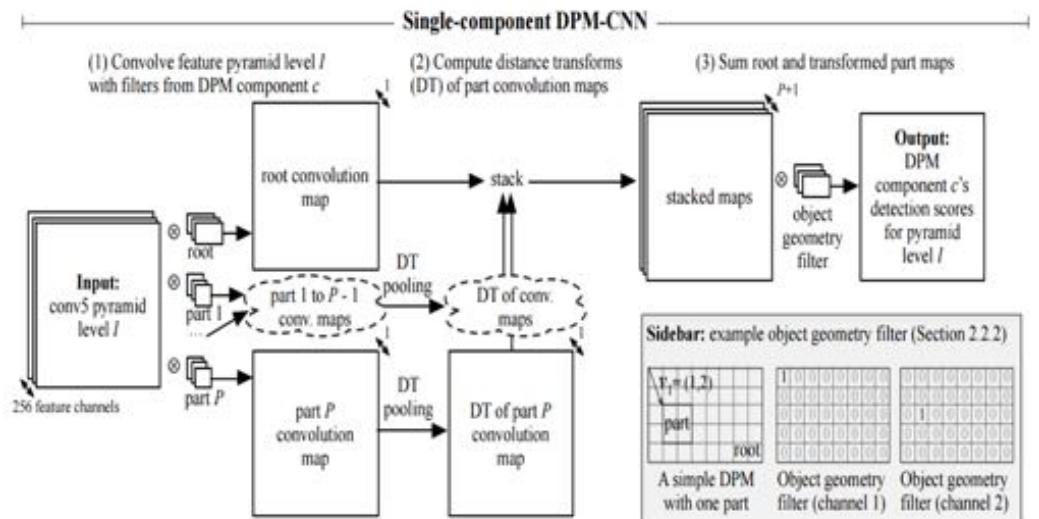

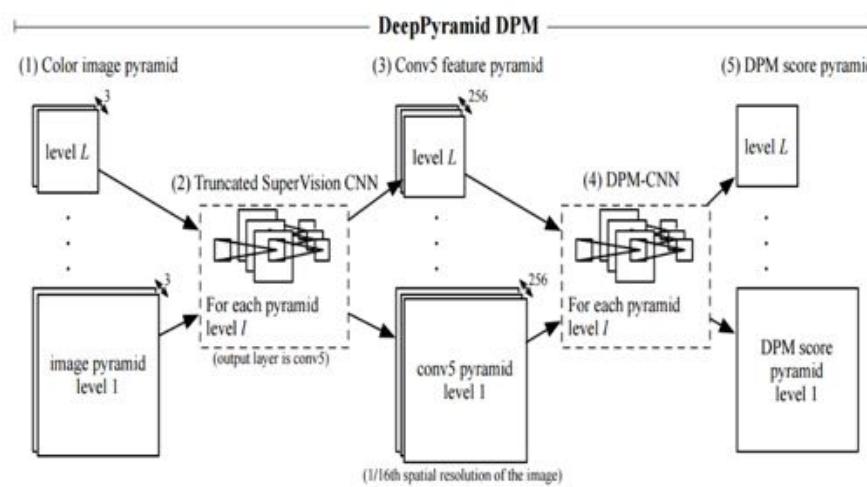

Deformable Parts Model (DPM)

Felzenszwalb et al, "Object Detection with Discriminatively Trained Part Based Models", PAMI 2010

Aside: Deformable Parts Models are CNNs?

Girschick et al, “Deformable Part Models are Convolutional Neural Networks”, CVPR 2015

Detection as Classification

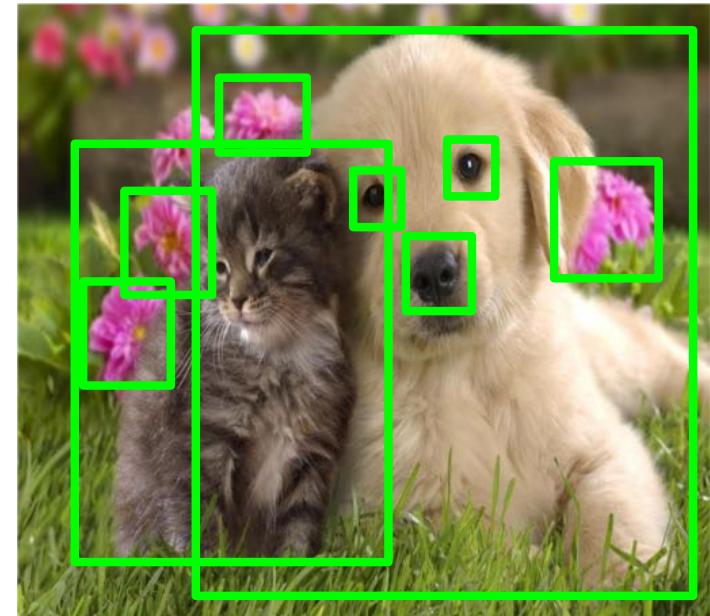

Problem: Need to test many positions and scales,
and use a computationally demanding classifier (CNN)

Solution: Only look at a tiny subset of possible positions

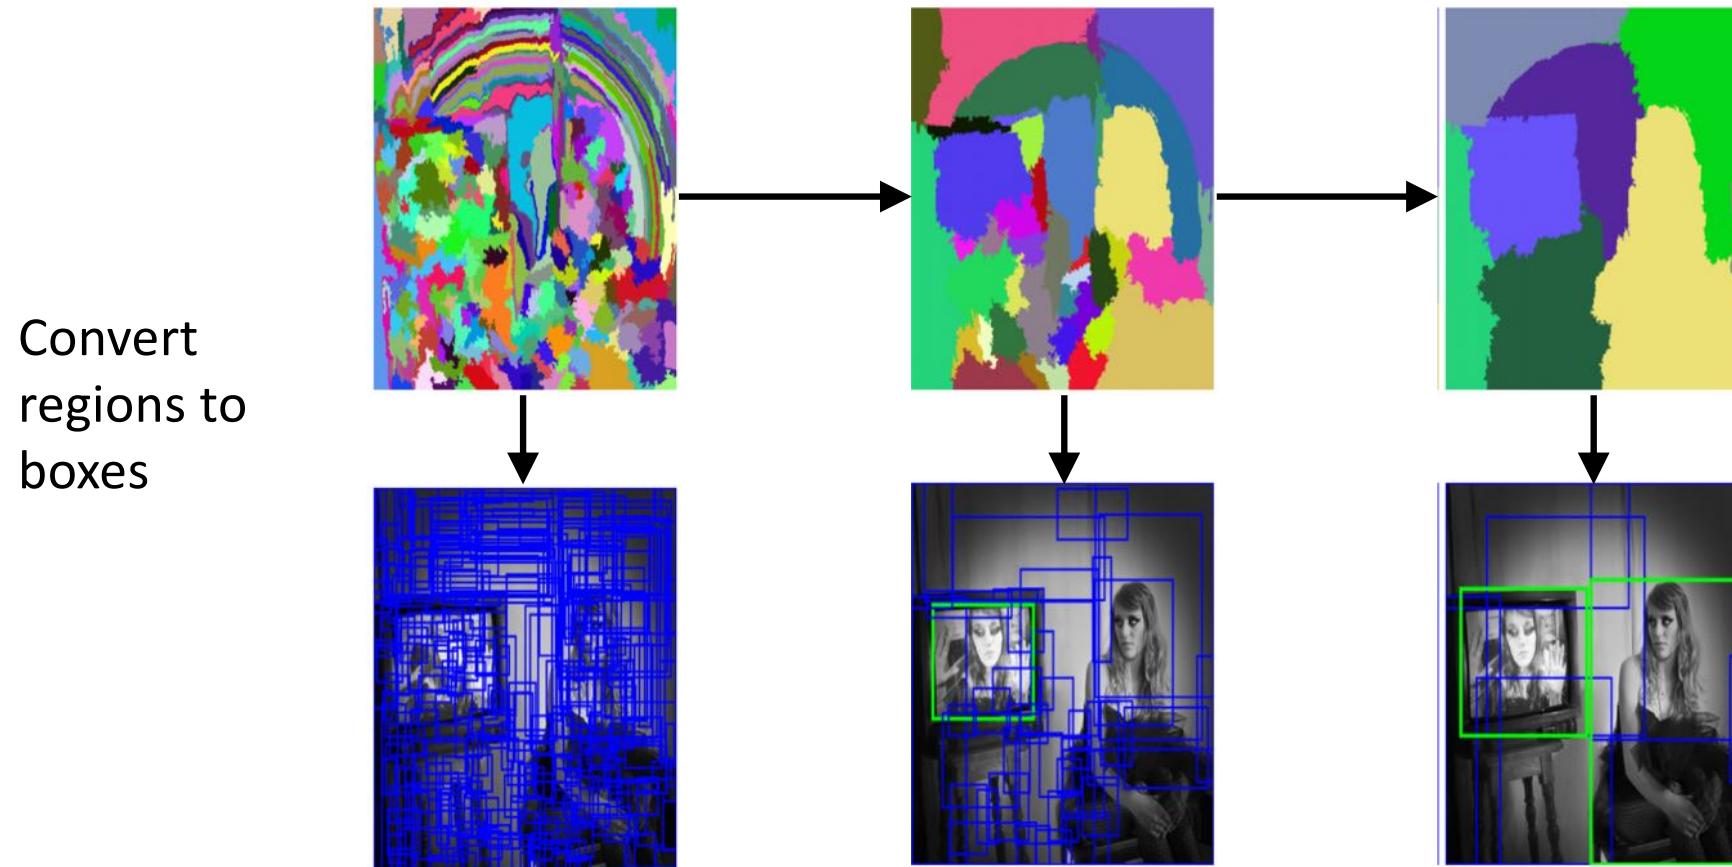

Region Proposals

- Find “blobby” image regions that are likely to contain objects
- “Class-agnostic” object detector
- Look for “blob-like” regions

Region Proposals: Selective Search

Bottom-up segmentation, merging regions at multiple scales

Uijlings et al, "Selective Search for Object Recognition", IJCV 2013

Region Proposals: Many other choices

Putting it together: R-CNN

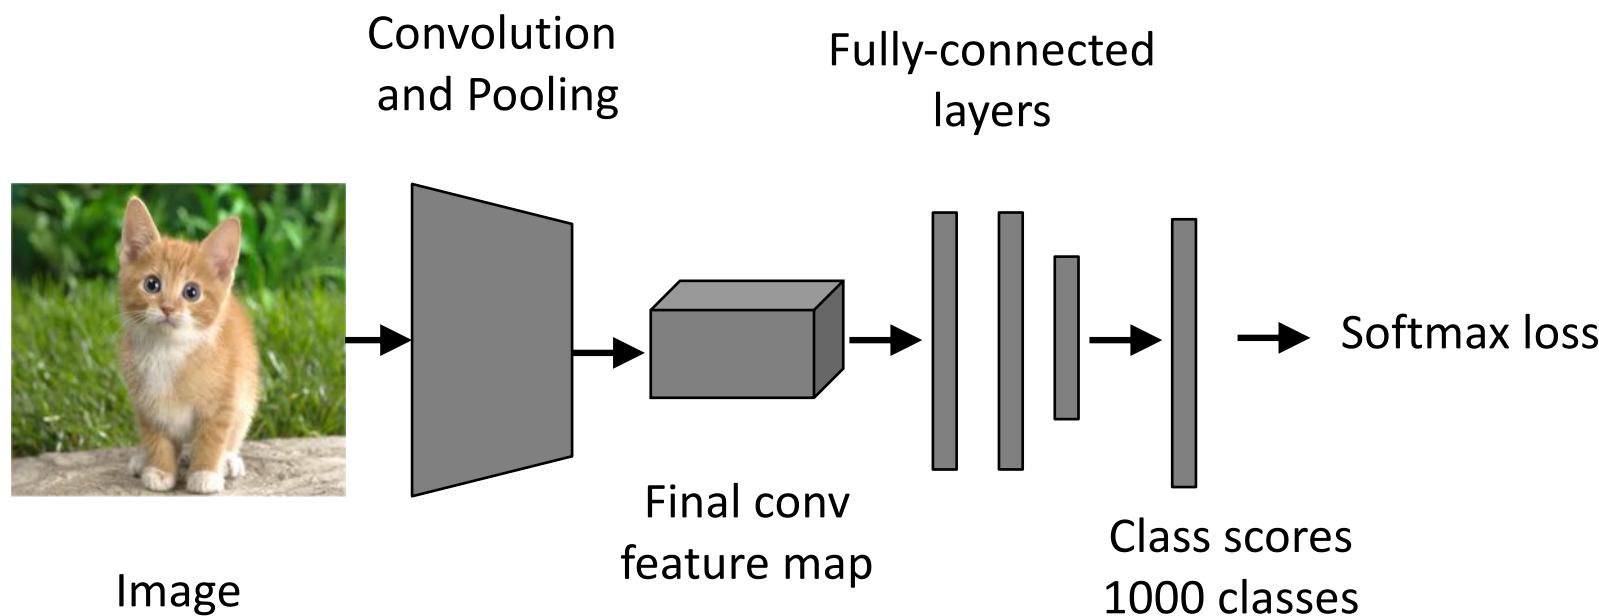

Girshick et al, "Rich feature hierarchies for accurate object detection and semantic segmentation", CVPR 2014

Slide credit: Ross Girshick

R-CNN Training

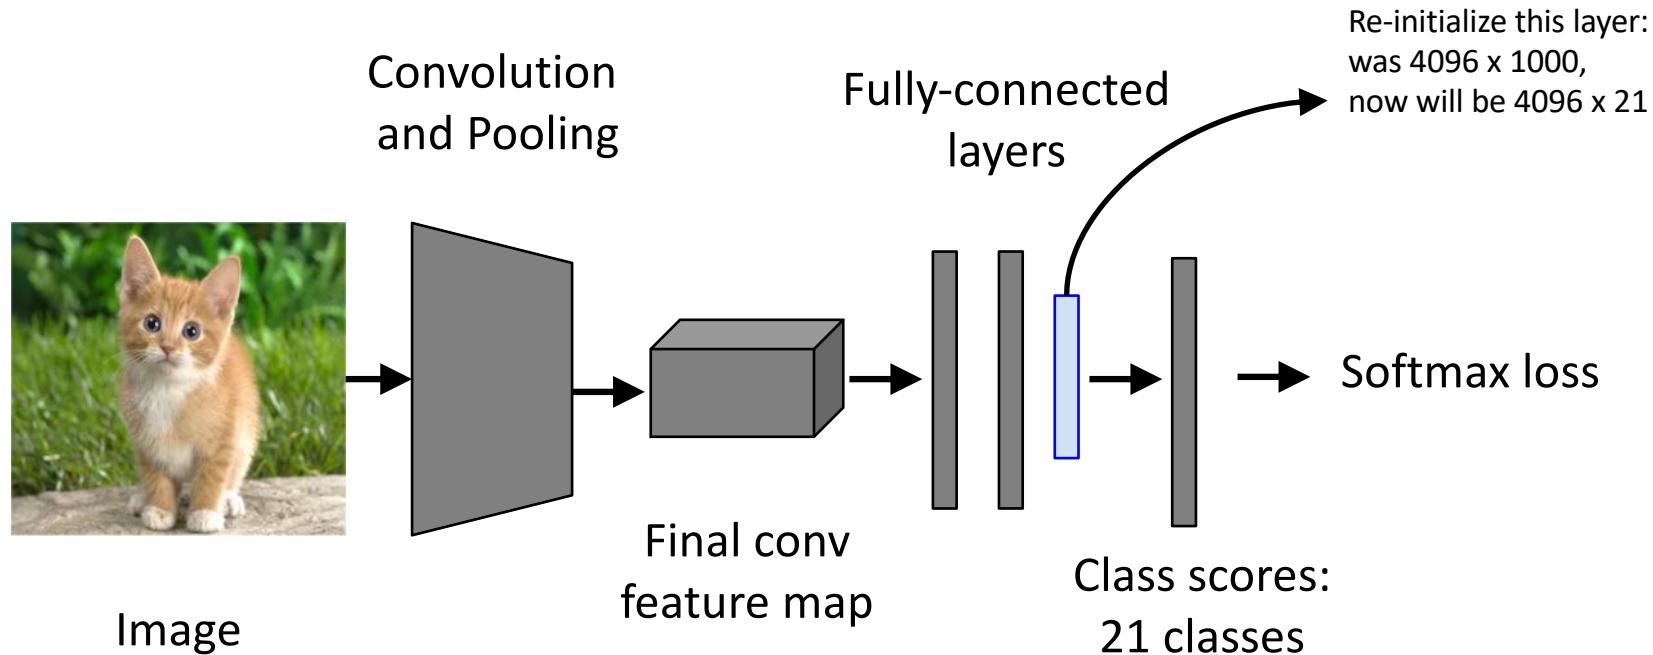

Step 1: Train (or download) a classification model for ImageNet (AlexNet)

R-CNN Training

Step 2: Fine-tune model for detection

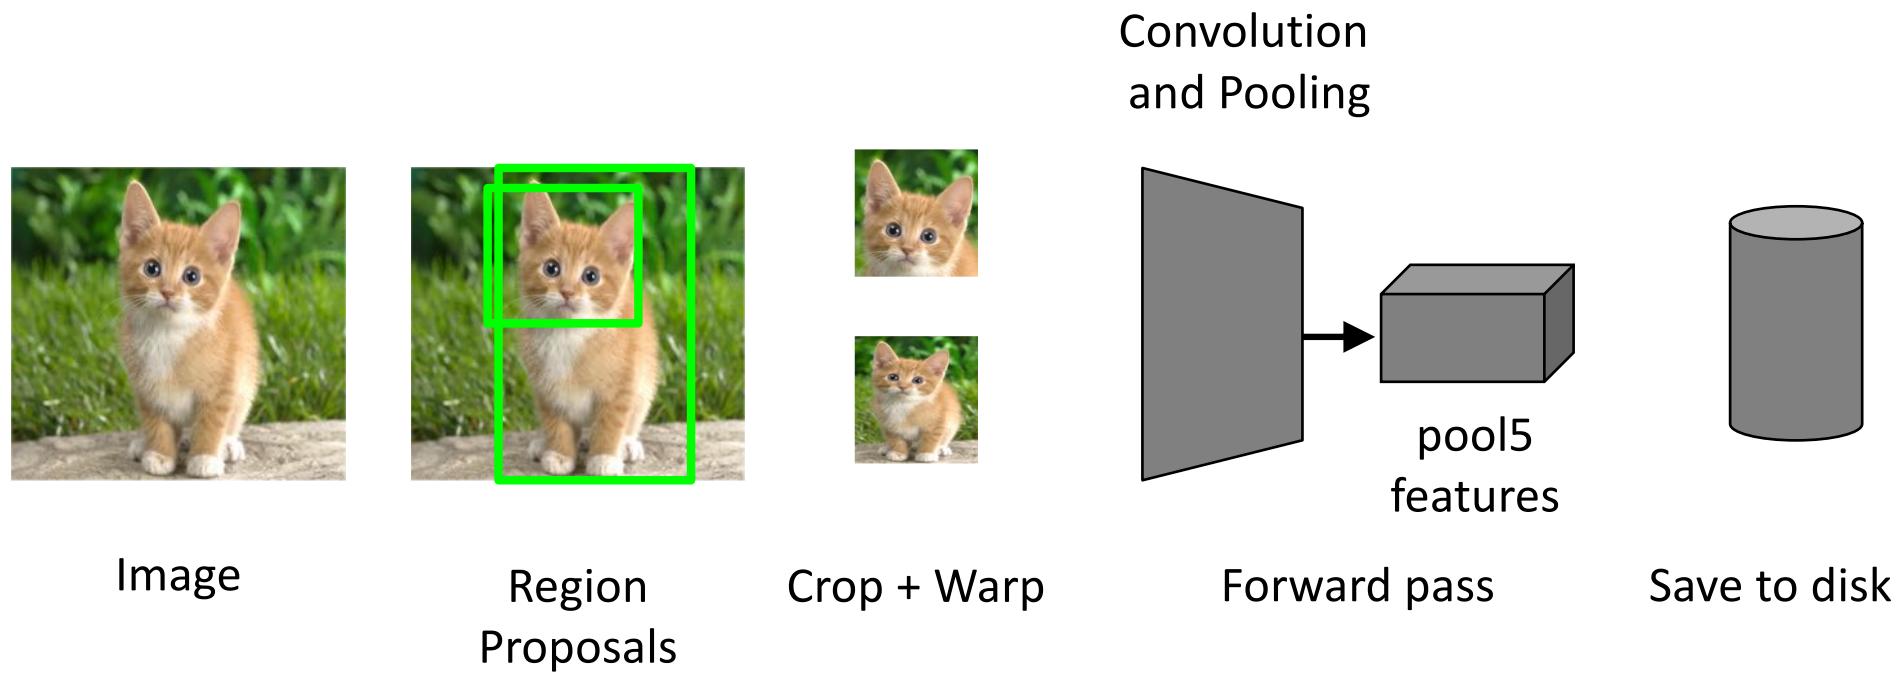

- Instead of 1000 ImageNet classes, want 20 object classes + background
- Throw away final fully-connected layer, reinitialize from scratch
- Keep training model using positive / negative regions from detection images

R-CNN Training

Step 3: Extract features

- Extract region proposals for all images
- For each region: warp to CNN input size, run forward through CNN, save pool5 features to disk
- Have a big hard drive: features are ~200GB for PASCAL dataset!

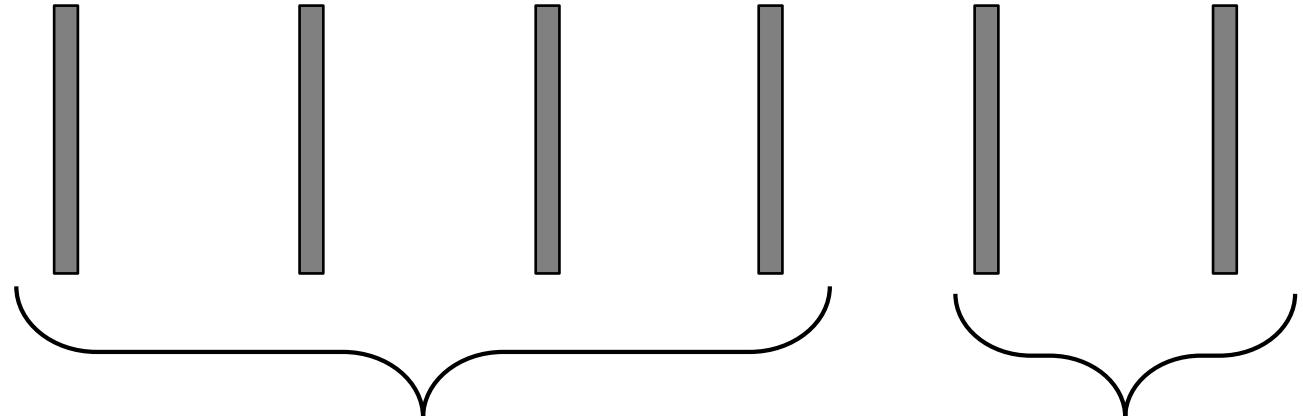

R-CNN Training

Step 4: Train one binary SVM per class to classify region features

Training image regions

Cached region features

Positive samples for cat
SVM

Negative samples for cat
SVM

R-CNN Training

Step 5 (bbox regression): For each class, train a linear regression model to map from cached features to offsets to GT boxes to make up for “slightly wrong” proposals

Training image regions

Cached region features

Regression targets
(dx , dy , dw , dh)
Normalized coordinates

$(0, 0, 0, 0)$
Proposal is good

$(.25, 0, 0, 0)$
Proposal too far to left

$(0, 0, -0.125, 0)$
Proposal too wide

Object Detection: Datasets

	PASCAL VOC (2010)	ImageNet Detection (ILSVRC 2014)	MS-COCO (2014)
Number of classes	20	200	80
Number of images (train + val)	~20k	~470k	~120k
Mean objects per image	2.4	1.1	7.2

Object Detection: Evaluation

We use a metric called “mean average precision” (mAP)

Compute average precision (AP) separately for each class, then average over classes

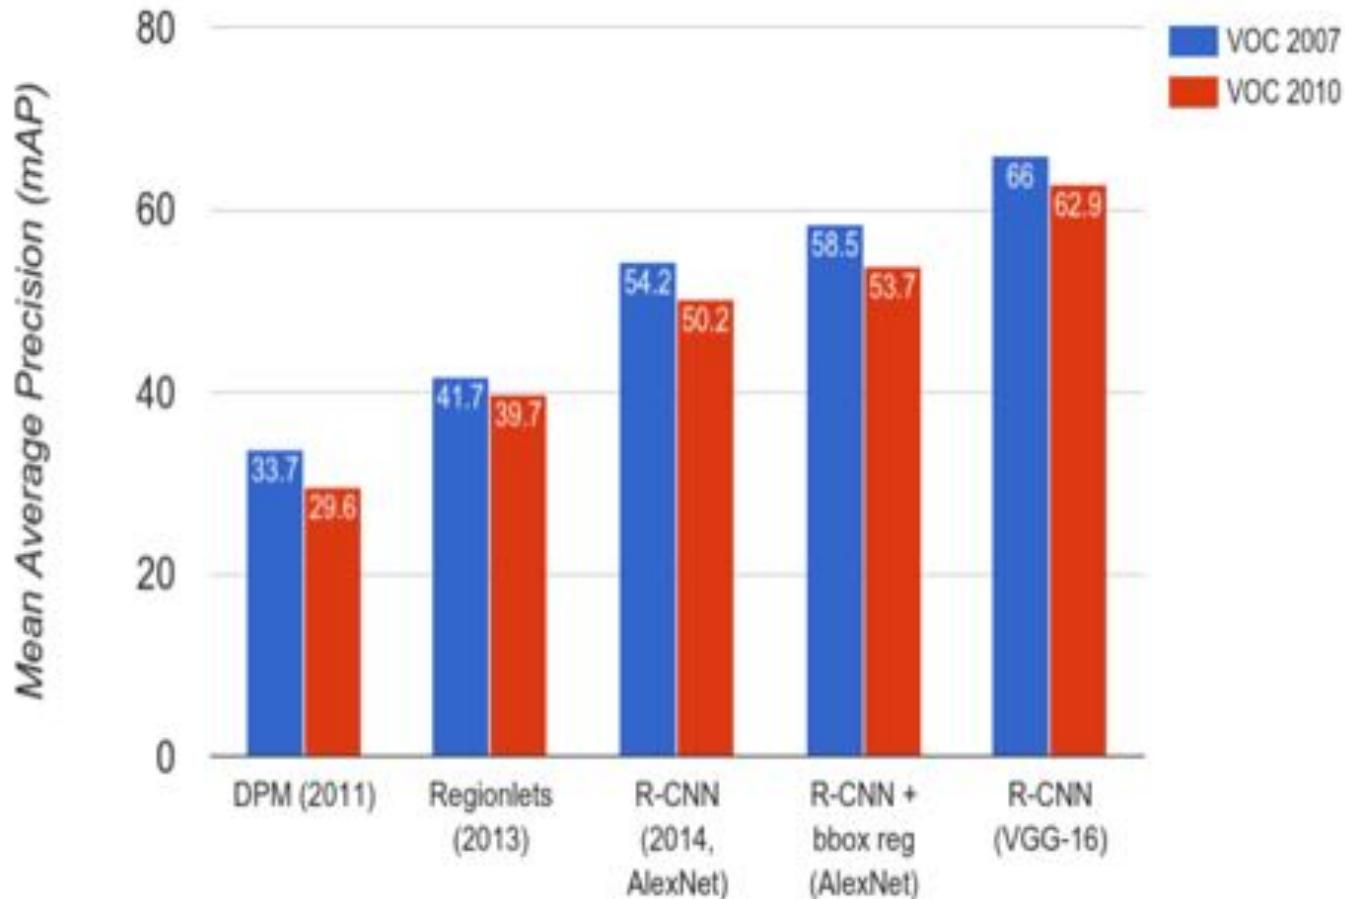

A detection is a true positive if it has IoU with a ground-truth box greater than some threshold (usually 0.5) (mAP@0.5)

Combine all detections from all test images to draw a precision / recall curve for each class; AP is area under the curve

TL;DR mAP is a number from 0 to 100; high is good

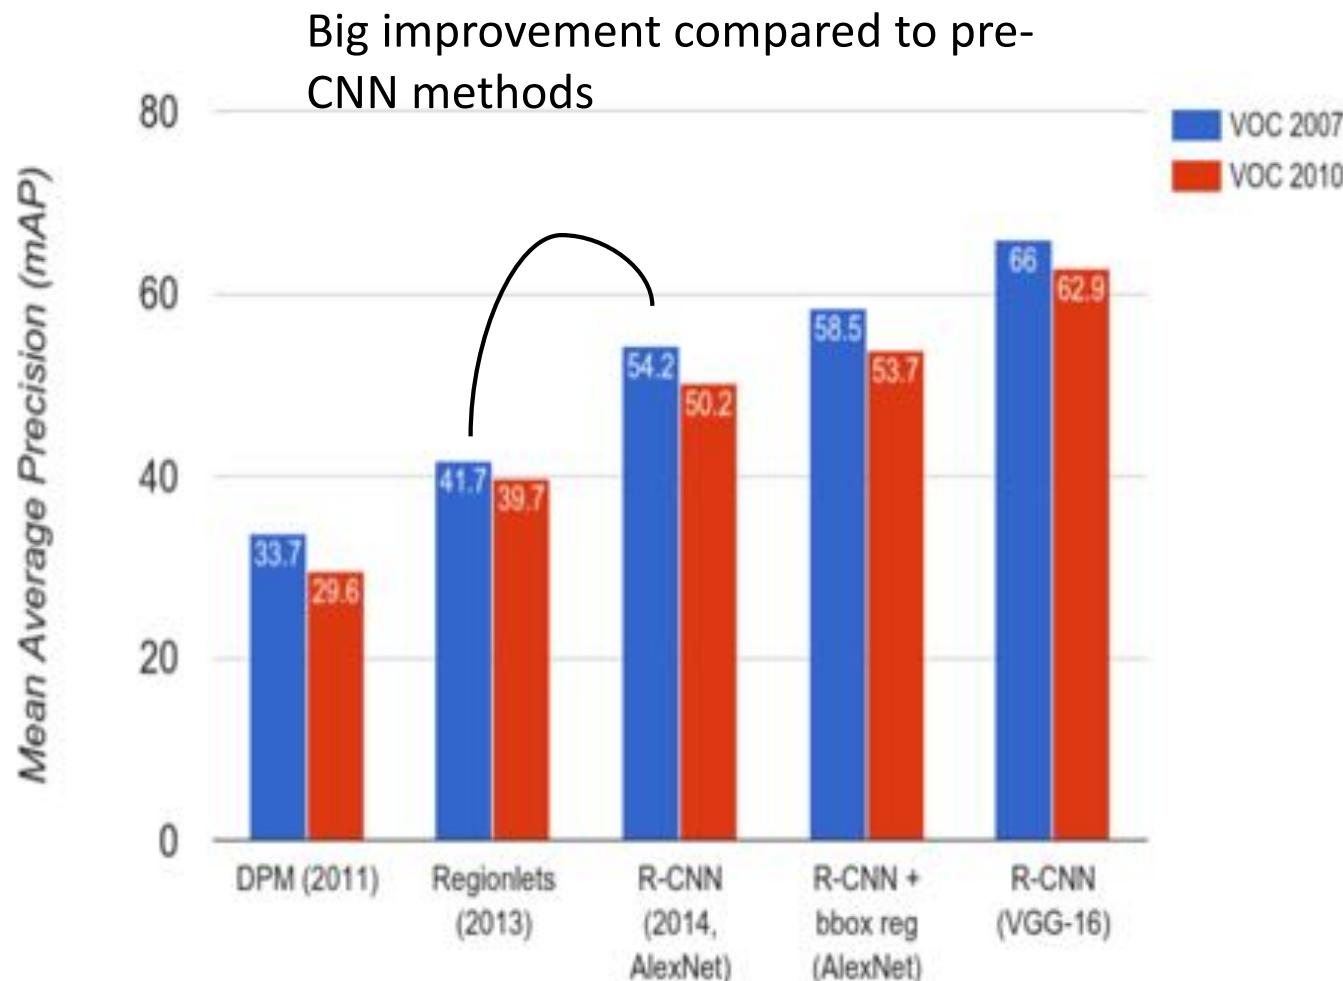

R-CNN Results

Faster R-CNN:

Insert a **Region Proposal Network (RPN)** after the last convolutional layer

RPN trained to produce region proposals directly; no need for external region proposals!

After RPN, use RoI Pooling and an upstream classifier and bbox regressor just like Fast R-CNN

Ren et al, “Faster R-CNN: Towards Real-Time Object Detection with Region Proposal Networks”, NIPS 2015

Slide credit: Ross Girschick

Faster R-CNN: Region Proposal Network

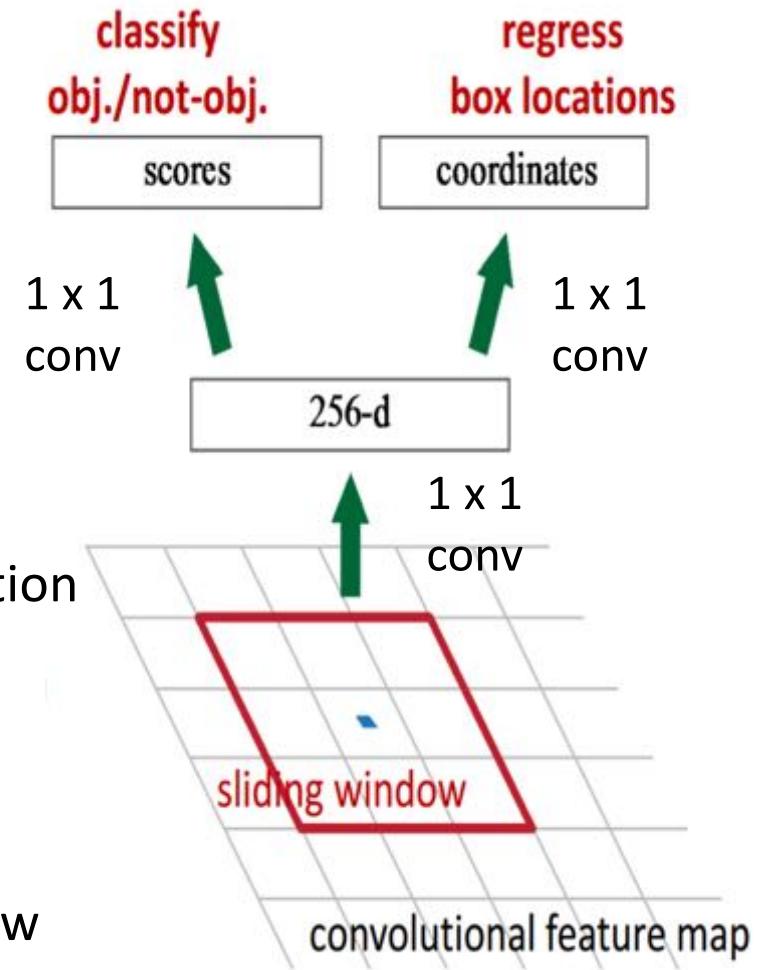

Slide a small window on the feature map

Build a small network for:

- classifying object or not-object, and
- regressing bbox locations

Position of the sliding window provides localization information with reference to the image

Box regression provides finer localization information with reference to this sliding window

Slide credit: Kaiming He

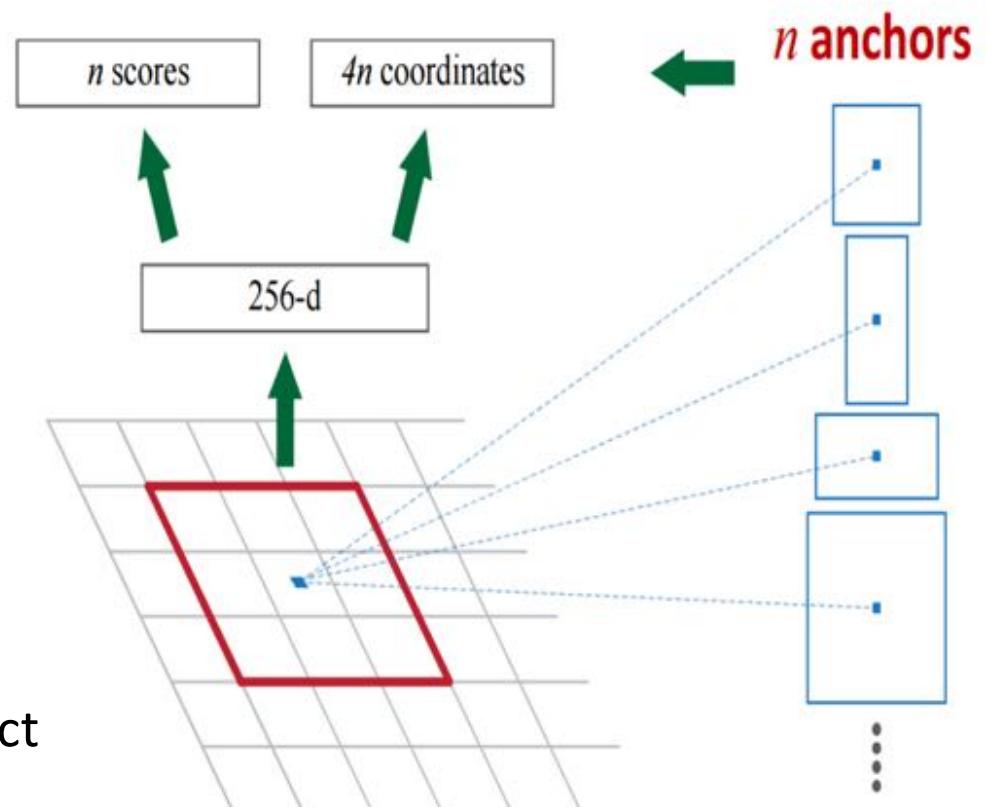

Faster R-CNN: Region Proposal Network

Use N anchor boxes at each location

Anchors are **translation invariant**: use the same ones at every location

Regression gives offsets from anchor boxes

Classification gives the probability that each (regressed) anchor shows an object

Faster R-CNN: Training

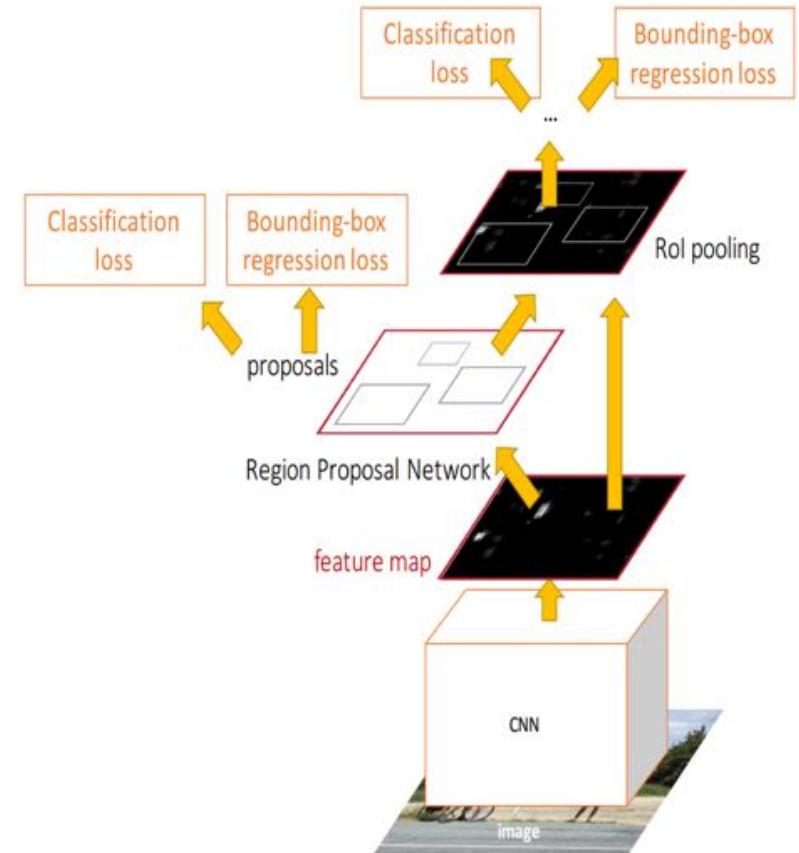

In the paper: Ugly pipeline

- Use alternating optimization to train RPN, then Fast R-CNN with RPN proposals, etc.
- More complex than it has to be

Since publication: Joint training!

One network, four losses

- RPN classification (anchor good / bad)
- RPN regression (anchor \rightarrow proposal)
- Fast R-CNN classification (over classes)
- Fast R-CNN regression (proposal \rightarrow box)

Slide credit: Ross Girsich

But this might not be the human way

The screenshot shows a research article from the journal *Current Biology*. The article is titled "Humans, but Not Deep Neural Networks, Often Miss Giant Targets in Scenes". It is a report by Miguel P. Eckstein, Kathryn Koehler, Lauren E. Welbourne, Emre Akbas, and David C. Knill. The article discusses how humans often miss targets when their size is inconsistent with the rest of the scene, even when the targets are made larger and more salient. In contrast, deep neural networks do not exhibit such deficits. The image below the article shows a bathroom sink with various items on it, illustrating the concept of a target being inconsistent with its surroundings.

Summary

Even with great advances in machine vision, animals are still unmatched in their ability to visually search complex scenes. Animals from bees [1, 2] to birds [3] to humans [4, 5, 6, 7, 8, 9, 10, 11, 12] learn about the statistical relations in visual environments to guide and aid their search for targets. Here, we investigate a novel manner in which humans utilize rapidly acquired information about scenes by guiding search toward likely target sizes. We show that humans often miss targets when their size is inconsistent with the rest of the scene, even when the targets were made larger and more salient and observers fixated the target. In contrast, we show that state-of-the-art deep neural networks do not exhibit such deficits in finding mis-scaled targets but, unlike humans, can be fooled by target-shaped distractors that are inconsistent with the expected target's size within the scene. Thus, it is not a human deficiency to miss targets when they are inconsistent in size with the scene; instead, it is a byproduct of a useful strategy that the brain has implemented to rapidly discount potential distractors.

What have you learnt?

Localization:

- Find a fixed number of objects (one or many)
- L2 regression from CNN features to box coordinates
- Much simpler than detection; consider it for your projects!
- Overfeat: Regression + efficient sliding window with FC -> conv conversion
- Deeper networks do better

Object Detection:

- Find a variable number of objects by classifying image regions
- Before CNNs: dense multiscale sliding window (HoG, DPM)
- Avoid dense sliding window with region proposals
- R-CNN: Selective Search + CNN classification / regression
- Fast R-CNN: Swap order of convolutions and region extraction
- Faster R-CNN: Compute region proposals within the network
- Deeper networks do better
